The Voice/Data or Data Only Cellular System operates on DoorKing’s cellular network that is hosted on the AT&T 4G LTE network where available. The system provides voice communication, data communication, or both, depending on the registration plan selected on DoorKing’s Cellular Server website.

The VOICE/DATA or DATA ONLY Cellular System is designed to be used with:
- 1833, 1834, 1835, 1837, and 1838 entry systems.

The Voice/Data cellular system MUST be wired to the telephone entry system’s phone line (voice) and RS 232 connection (data). See page 3.

The Data Only cellular system is only wired to the telephone entry system’s RS 232 connection (data). See page 3.

The Voice/Data or Data Only cellular system will work with TWO 1830 entry systems connected to it. These are designated as System A and System B. See page 3 to wire 2 1830 entry systems to the cellular system.

System Operating Temperature Range: -10F (-23C) to 125F (52C).

Prior to Installation:
An existing cellular phone will be needed to test the signal strength of DoorKing’s cellular network in the desired installation location (a smart phone is preferred).

**Analog modems (Dial-Up) DO NOT work on a cellular network.**

BEFORE the cellular system can be installed, the installation location MUST BE TESTED for good cellular signal strength for reliable communication. TEST this location using an existing active cellular phone with AT&T phone service.

**Note:** Other cellular phone services use different networks and will not work for testing signal strength of the cellular system.

Activate the phone near the position where you want the plastic enclosure to be installed. 3-4 bars of signal strength should be indicated on the phone for a reliable signal. If 3-4 bars are not achievable in that specific location, then try moving the phone around and see if at least 3-4 bars can be achieved and maintained in a nearby location. If a smart phone is being used, try using the browser to connect to a website to verify good data transfer. DO NOT install the enclosure in a WEAK or NO signal area. DoorKing offers an exterior 4G LTE cellular antenna that can help in areas with weak cellular service (P/N 1514-014 Sold separately). Generally, the higher the enclosure is mounted, the better the reception. This also helps protect against vandalism. The enclosure should be located to minimize the wire runs to “SYSTEM A” 1830 telephone entry system. Keep the wire run between the two devices as short as possible, maximum 100 feet. This allows less chance for lightning surges or other electrical interference to disrupt the cellular signal. Keep the enclosure away from any metal. This can also disrupt the signal. After the 3-4 bar signal strength has been confirmed (and the smart phone has good browser data transfer if used for signal testing), the installation can begin.

Installation Steps:
1. Install and wire cellular system to 1830(s) (page 2 & 3).
2. Power up cellular system (page 4).
3. Register cellular system (and 1830(s)) online, this can be done before or after cellular system has been installed (page 4).
4. Test cellular system (page 4).
5. Program cellular system (pages 5 & 6).
6. Troubleshoot cellular system if necessary (page 6).

**Note:** Installation steps assume that a good cellular signal has been tested at installation location and the 1830 system(s) has already been setup and functioning including the master code and multiple system programming if 2 1830s are being used.
The plastic enclosure comes with mounting brackets and hardware to mount on enclosure. Mount enclosure on surface using appropriate hardware (not included). IT IS NOT RECOMMENDED DRILLING HOLES IN THE PLASTIC ENCLOSURE! If holes must be drilled, remove the circuit board before drilling and be sure that mounting bolts/screws DO NOT touch the back of the circuit board. Holes must be sealed to prevent water intrusion.

If the cellular control box is installed OUTDOORS, watertight conduit and connectors MUST be used for ALL field wiring connections.

Wiring methods used shall be in accordance with National Electrical Code, ANSI/NFPA 70.
Permissible wire sizes for the terminals (12-26 AWG).

<table>

**DKS Cellular Server**

hosted by AT&T cellular network
with DKS Online Registration Completed

LED on Enclosure Door
“AC power ON” indicator

---

**Voice/Data Cellular System**

**CELLULAR MODULE LEDs:**
- **Signal Strength Bars:**
  - Green - More bars, more signal strength.
  - Bars only display when call is being made.
- **SIM Status:**
  - Red blinking (error, usually NO SIM)
- **POWER Icon:**
  - ON (has power)

**RS 232 Connection**
- System B Terminal
  - DATA OUT-Red 1
  - DATA IN-Black 2
  - BUSY OUT-White 3
  - BUSY IN-Brown 4
  - GROUND-Green 5

**1830 Terminal**
- DATA OUT-Red 1
- DATA IN-Black 2
- BUSY OUT-White 3
- BUSY IN-Brown 4
- GROUND-Green 5

**Supplied Power Transformer**
- 16.5VAC 40 VA

---

**Wiring methods used shall be in accordance with National Electrical Code, ANSI/NFPA 70.**

Permissible wire sizes for the terminals (12-26 AWG).

**Note:** Old 1830 series circuit boards can be updated to Rev W or higher for better DTMF tone distortion.

---

**System B Phone Line Alternate Use**
- If system B is NOT being used for a second phone entry system, a phone can be installed and used. It shares the phone line with the System A phone entry system. The phone **CANNOT** be used while a transaction is taking place on System A.

---

**Note:** 1830 Aux Terminals 1&2 **MUST** be powered.

---

**Note:** 1830 Aux Terminals 1&2 **MUST** be powered.
Voice/Data Cellular System Needed Information

Powering Up System - The Voice/Data cellular system will NOT function until online registration has been successfully completed on DoorKing's Cellular website. Within 1 minute of powering up the cellular module, the lights should turn on. If they don’t, check that the ON/OFF button is turned ON. Signal strength Bars should be lit GREEN indicating good cell reception. YELLOW bars indicate poor reception but may still work. RED bars indicate no reception. The cellular module’s lithium battery needs time to charge. Allow at least ½ hour of charging time before using system.

Using Two 1830 Entry Systems - Each 1830 must be programmed for MULTIPLE SYSTEMS. See specific 1830 Installation/Owner's instruction manual for information to program each 1830.

TWO 1830 Entry Systems Master Codes - Each 1830 entry system's Master Code must be DIFFERENT. The DKS cellular server identifies each 1830 by its unique master code. This allows separate programming for each 1830.

Voice/Data Cellular System Master Code - IMPORTANT: Program the Voice/Data cellular system master code the SAME as System A's master code. See Programming for instructions on how to set the cellular system master code on page 5. The DKS cellular server may need to contact the Voice/Data cellular system and use System A’s master code to do so.

RS 232 Baud Rate for Older 1830s - The Voice/Data cellular system and the 1830 entry system(s) MUST have matching RS 232 baud rates (bps). Newer 1830s and the Voice/Data cellular system default to 19,200bps but older 1830s may be running at ONLY 9600bps. It is preferred re-programming older 1830s to 19,200bps. If the older 1830s cannot be re-programmed up to 19,200bps, then the Voice/Data cellular system can be re-programmed down to 9600bps to match the older 1830s. Contact tech support for instructions on how to re-program the cellular system down to 9600bps.

Online Registration MUST be Completed

DKS Cellular requires a SEPARATE registration from the DKS IM Server. If a customer already has an IM Server account and wants to add a DKS Cellular system, this will require a SEPARATE User ID and Registration.
- DKS IM Server includes: IM Server modem and IM Server Client.
- DKS Cellular includes: Cellular Phone and Data Transfer.

Before registering a cellular system on DoorKing's Cellular Server you will need:
- SIM ID number located on the cellular module (number is unique for each cellular module).
- Master Code of System A.
- Master Code of System B if connected, MUST be a different master code than System A.

OPTION 2. Online registration is directly offered when installing the DoorKing Remote Management Software version 6.3.g or later on YOUR internet connected PC. Create an account and select whether the account will manage:
- Voice and Data (entry systems 1833,1834,1835,1837, or 1838 with voice)
- Data Only (1838 with no voice)
- Voice Only (limits available features that can be used on all 1830 entry systems and is not recommended for the 1830s)

Enter the SIM ID number to identify the Cellular System to the account created. After the SIM ID number is entered along with the local billing address, a local cellular phone number will be assigned to that cellular device.

Register the 1830 systems (Master Codes) to the account. The FIRST 1830 master code entered will be identified as System A. If a second 1830 master code is entered, it will be identified as System B.

Testing

Final Testing after the Cellular System has been Registered - All systems should be tested and final adjustments done. Connect a telephone butt set to the cellular system circuit board Phone Line and make sure the line is active and that phone calls may be made and received.

If the phone line is not active, something went wrong during the registration which must be corrected. If still having problems, call DoorKing tech support. Attach a label to the inside of the cellular enclosure listing the local phone number that was assigned during registration. For DATA ONLY cellular systems skip the voice testing and proceed to remote program testing.

Voice Testing - On the 1830 circuit board lower left corner is a jumper for phone line matching. Remove the jumper from the UPPER position and place it on the LOWER position labeled 1816. This allows the 1830 speakerphone OPTIMUM performance when using cellular and MUST be done.

Program a phone number into the memory of the 1830. If a second 1830 is connected, a second phone number should be added. The call recipient press “9” on their phone to open the door. Verify the 9 tone is detected (door will open). Adjust the feedback on 1830 as necessary. This adjustment is VERY important for DTMF detection. See specific 1830 Installation/Owner’s instruction manual for programming and adjustment information.

IMPORTANT Note: Factory set Tone Open numbers: “9” TONE activates Relay 1. “0” TONE activates Relay 0. “5” TONE activates Relay 2.

For cellular, change the tone open number for Relay 2 to “8” TONE. Leave Relay 1 and Relay 0 tone open numbers the same.

Remote Program Testing - Install DoorKing Remote Management Software version 6.3.g or later on an internet connected PC that will be used for 1830 programming and management. Create an account and open the system Info screen. Enter System A's master code, phone number that has been assigned, and pick DKS Cellular for the service type. If a second 1830 is connected, create a second account with the same settings as above except System B’s master code MUST be different. Refer to the Remote account manager software manual for additional settings which MUST be made.

Enter some test data into the resident screen and then attempt to send the data to the 1830.
Programming

Program Slide Switch - Slide this switch to program when programming the board LOCALLY using a touch tone telephone. Be sure to switch back to Normal when finished programming. Cellular voice will NOT work with program slide switch set to PROGRAM.

Setting the Master Code for Voice/Data Cellular System:
Slide switch to Program
Connect a touch tone phone to System A phone terminals. Press and release the Master Code push button. Enter on the phone the new 4 digit Master Code and then press *. A tone should be heard in the phone ear piece. The new master code is now programmed. Hang up the phone to end programming.
Note: The cellular system’s master code MUST be the SAME as System A 1830 master code. This is how the DKS cellular server identifies the cellular system to contact it if needed. Set the slide switch back to Normal if done, or leave in Program if more programming will be done.

Cycle Power to the Cellular Module:
This will cycle power to the cellular module if power is ON or it will turn ON the module if it is OFF. This allows the module to re-connect with the cellular network.
Slide Switch to Program:
• 87 Master Code(Beep) 01+(Beep) 1+(Beep) to cycle power or 0+(Beep) to NOT cycle power.
Hang up Phone Slide switch back to Normal if done programming.

TCP/RS 232 Factory Defaults
This will RESET the TCP/RS 232 module back to factory defaults.
Slide switch to Program:
• 87 Master Code(Beep) 02+(Beep) 1+(Beep) to reset defaults or 0+(Beep) to NOT reset defaults.
Hang up phone. Slide switch back to Normal if done programming.

Cycle Power to Cellular Module Schedule:
This schedules the number of days between automatic power cycling of the cellular module. This allows the module to re-connect with the cellular network after periods of non-usage. The revision letter of YOUR specific circuit board will restrict programming to either “number of days-Rev A ONLY” OR “number of hours-Rev B or higher”.

“Rev A” Circuit Board ONLY, “0-9” number of days:
Note: 0= no cycle. 1= every day. 2= every two days, 3= every three days etc. Up to every 9 days.
Factory default setting: every 3 days.
Slide switch to Program
• 87 Master Code(Beep) 03+(Beep) 0-9+(Beep) number of days to cycle power.
Hang up phone. Slide switch back to Normal if done programming.

“Rev B or higher” Circuit Boards, “00-99” number of hours:
Note: 00= no cycle. 01= every hour; 02= every two hours, 03= every three hours etc. Up to every 99 hours.
Factory default setting: every 3 hours.
Slide switch to Program
• 87 Master Code(Beep) 03+(Beep) 00-99+(Beep) number of hours to cycle power.
Hang up phone. Slide switch back to Normal if done programming.

Number of Rings to Answer Call:
Sets the number of rings for an incoming call before the cellular system will answer. 2= two rings, 3= three rings, etc. Up to 9 rings. (2-9)
Normally the 1830 will answer on the second ring. In this case the cellular system will listen in for DTMF tones •87 Master code. If received, the cellular system will stay on the line for programming while the 1830 will hang up. If any other DTMF tones are received, the cellular system will ignore them. If the 1830 does not answer on the second ring, the cellular system will answer on the programmed number of rings.
Factory default setting: 5 rings.
Slide switch to Program
• 87 Master Code(Beep) 04+(Beep) 2-9+(Beep) number of rings before answering call.
Hang up Phone. Slide switch back to Normal if done programming.

TCP/RS 232 Power Cycle:
Sometimes it is necessary to cycle power to the TCP/RS 232 module to re-establish an Ethernet connection to the cellular module.
Slide switch to Program
• 87 Master Code(Beep) 05+(Beep) 1+(Beep) to cycle power to TCP/RS 232 module or 0+(Beep) to not cycle power.
Hang up phone. Slide switch back to Normal if done programming.

Multiple Program Note: Once the •87 Master Code(Beep) has been keyed in and programming mode is entered, it is possible to program multiple functions without leaving the programming mode. Just complete one program step and then go to the next.

Programming Example: Master Code is 1234. Cycle power to the cellular module and then cycle power to the TCP/RS 232 module.

1800-065 Issued 1-19
Version E
Remotely Programming

The Voice/Data Cellular System can also be programmed remotely from a cellular phone or LAN line phone.

Call the telephone number of the cellular system. After a couple of rings the system will answer and respond with an answer tone.

Programming may now proceed on previous page. To end programming press “#” and then hang up.

**Note:** An older entry system may need to have the circuit board upgraded to be able to program remotely because of distorted DTMF tones from the cellular network. Update older 1830 boards to Rev W or higher for better DTMF tone detection.

Troubleshooting

**IMPORTANT:** The cellular network distorts DTMF tones received by the entry system. Update older 1830 boards to Rev W or higher for better DTMF tone detection.

The greatest distortion exists for keys 1-2-3-4-5-6. Keys 7-8-9-0-#* work better. Because of this, **ONLY** the latter keys should be used for TONE OPEN numbers and the MASTER CODE. The entry system will perform better if keys 7-8-9-0-#* are used AND the feedback adjustment on the 1830 entry system has been optimized for the cellular system (see “Voice Testing” on page 4).

**Note:** The Master Code can only be programmed using numbers and not the “*” or “#” keys.

**Voice Not working:**

Are the lights on the cellular module ON? If not, look for circuit board power LED. If ON, program the board to cycle power ON to the cellular module. See “Cycle Power to the Cellular Module” programming on page 5. Power transformer MUST NOT be connected to a receptacle controlled by a switch.

Program/Normal slide switch is in left PROGRAM position. Slide back to NORMAL position.

Poor cellular reception. Look for cellular module “Signal Strength Bars” to be GREEN. If bars are YELLOW or RED, poor or no reception is occurring.

Registration is not complete OR DATA ONLY has been selected. Service suspended because of past due bill. Contact Doorking for support.

**Data Transfer Not Working:**

Are the lights on the cellular module ON? Is the board power LED ON? If yes, program the board to cycle power to the cellular module. See “Cycle Power to the Cellular Module” programming on page 5. Power transformer MUST NOT be connected to a receptacle controlled by a switch.

Poor cellular reception. Look for cellular module “Signal Strength Bars” to be GREEN. If bars are YELLOW or RED, poor or no reception is occurring.

Registration is not complete OR VOICE ONLY has been selected. Service suspended because of past due bill. Contact Doorking for support.

Wiring error from the cellular system to the entry system. Check RS 232 wiring.

Master code mismatch. Master code for the 1830(s), PC software, and DKS cellular website MUST match each other.

Check for remote account manager error messages for failure reasons such as memory size, anti passback mismatch, etc, and correct errors.

1830 wiegand/RS 232 power is missing. Check for 16.5VAC at 1830 auxiliary terminals 1,2.

Try connecting a laptop directly to the 1830 and see if possible to transfer data.

Check the LED lights on the Voice/Data cellular circuit board. During a data transfer the yellow Ethernet data LED should be flashing. The data LED near the RJ45 cable should be flashing. The RS 232 LEDs should be flashing for the proper system either A or B indicating attempted data transfer. If the wrong RS 232 LEDs are flashing, A and B systems are mixed up.

Check the 1830 baud rate setting. It should be 19200bps. See specific 1830 Installation/Owner’s manual. Older 1830s only run at 9600bps (Rev L and earlier) (K and earlier 1838 boards) change the RS 232 baud rate setting on the cellular device. Call DoorKing tech support for help.

Network cable (RJ45 cable) loose or unplugged on the cellular board.

Cycle power to the TCP/RS 232 adapter. See “TCP/RS 232 Power Cycle” programming on page 5.
FCC Regulations

This device complies with part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

This device has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

Changes or modifications not expressly approved by the party responsible for compliance could void the user’s authority to operate the equipment.

RF Exposure Information

This device meets the government’s requirements for exposure to radio waves.

This device is designed and manufactured not to exceed the emission limits for exposure to radio frequency (RF) energy set by the Federal Communications Commission of the U.S. Government.

This device complies with FCC radiation exposure limits set forth for an uncontrolled environment.

Glossary for UL 294 Compliance

ACCESS CONTROL SYSTEM: A collection of means, measures and specific practices that when combined, form or compose a systematic approach, which enables an authority to control access to areas and resources in a given physical facility. An access control system, within the field of physical security, is generally seen as the second layer in the security of a physical structure.

ALARM: A condition indicating a state of alert or tamper detection.

ALARM SIGNAL: A transmission of an alarm condition or alarm report.

CONTROLLED AREA: A room, office, building, facility, premises, or grounds to which access is monitored, limited, or controlled.

EQUIPMENT: Any part of an electronic access control system, such as access control units, reader interface modules, access point actuators, access point sensors, keypads, and the like.

PROTECTED AREA: A room, office, building, facility, premise or grounds to which access is monitored, and limited and/or controlled, whereby the authorized person of the Access Control System may grant access to non-authorized persons.

RESTRICTED AREA: A room, office, building, facility, premise or grounds to which access is monitored, and limited and strictly controlled, whereby only the administrator of the Access Control System shall issue credentials that will lead to access.

PERFORMANCE LEVELS:

- Destructive Attack: Level I
- Line Security: Level I
- Endurance: Level IV
- Standby Power: Level I
- Single Point Locking Device: Level I
