Instructions for RS485 Relay Board
The RS485 Relay Board is designed to work with Access Plus systems. See reverse side for wiring information.

Setting the Relay Board Address
The only valid device addresses that can be used with the Access Plus system are 003 through 008. Each relay board must have a unique address and the addresses must start with 003 and continue in sequence. The type of device (card reader, keypad, etc.) connected to the relay board does not matter, only the address matters.

The small toggle switch and two rotary switches are used to set the address on the relay board. Since the address on the device must be set between 003 and 008, the toggle switch is set to the OFF position and the first rotary switch is set to 0. You only need to set the second rotary switch for the address of the device (003 – 008).

In the example at right, the relay board address is set for 003.

Each relay board must have a unique address and continue in sequence. Do Not Skip an address.
The order in which the relay board is connected to the Access Plus system does not matter. What is important is that the addresses must be in sequence starting with 003.

Wiegand Connections
The RS-485 Relay Board (2354-010) accepts input from 26-bit wiegand devices and then converts this data to RS-485 protocol for communication with the Access Plus system. The maximum distance that wiegand data lines can be run is 500 feet.

Using the 2354-010 circuit board, you can connect most 26-bit wiegand devices for use with the Access Plus system.
12 – 16 Volt, AC or DC power. Do not power from the Access Plus controller. Must be supplied with its own power source as shown.

Magnetic locks are wired to the Normally Closed relay contacts. Electric strikes are wired to the Normally Open relay contacts.

The wires connected from the Access Plus board (terminals 1 & 2) to the RS-485 boards (terminals 8 & 7) MUST be twisted. We recommend that you use Cat5e cable. Use one pair to these terminals and then one wire from one of the other pairs to connect terminal 6. If wiring will be outdoors or underground, use Cat5e Gel Filled (flooded) UV Resistant Direct Burial Cable. Match terminals on RS 485 board (i.e., term 6 to term 6; term 7 to term 7; term 8 to term 8).

A switch closure across terminals 9 & 10 will activate the relay for its programmed strike time.

Lock power. Do not power magnetic locks or electric strikes from the RS-485 circuit board power source. Locks must be powered from their own source.

SW 5 is in the OFF position for middle units, and in the ON position for end units. If terminals 6, 7 & 8 have two wires connected to them, the SW 5 must be OFF. If terminals 6, 7 & 8 have only a single wire connected, the SW 5 must be ON.

Maximum distance from end to end is 4000 feet in a Daisy Chain format as shown in the diagram at right.

If the AP Controller is an END unit, then SW 2 (on the AP Controller) is ON. If the AP Controller is a middle unit, then SW 2 (on the AP Controller) is OFF.
