Circuit Board Serial Number and Revision Letter: _______________________

Leave Manual with Owner
Use this manual for the Model 6500 operators with circuit board 4405-010 Rev E or higher ONLY.

**Class of Operation**
Model 6500 - UL325 Class I, II, III, IV

**Type of Gate**
Vehicular Swing Gates Only

**Entrapment Protection**
- **Primary** - Inherent entrapment sensing system (Type A)
- **Secondary** - Provision for connection of a non-contact sensor (Type B1)

Vehicular gates should be constructed and installed in accordance with ASTM F2200: Standard Specification for Automated Vehicular Gate Construction. For a copy of this standard, contact ASTM directly at 610-832-9585; service@astm.org; or www.astm.org.

**Important Safety Instructions**

**WARNING - To reduce the risk of injury or death:**

1. READ AND FOLLOW ALL INSTRUCTIONS.
2. Never let children operate or play with gate controls. Keep the remote control away from children.
3. Always keep people and objects away from gate. **NO ONE SHOULD CROSS THE PATH OF THE MOVING GATE.**
4. Test the operator monthly. The gate MUST reverse on contact with a rigid object or stop or reverse when an object activates the non-contact sensors. After adjusting the force or the limit of travel, retest the gate operator. Failure to adjust and retest the gate operator properly can increase the risk of injury or death.
5. Use the emergency release only when the gate is not moving.
6. KEEP GATES PROPERLY MAINTAINED. Read the owner’s manual. Have a qualified service person make repairs to gate hardware.
7. The entrance is for vehicles only. Pedestrians must use separate entrance.
8. **SAVE THESE INSTRUCTIONS!**

**Instructions regarding intended installation:**

- Install the gate operator only if:
  1. The operator is appropriate for the construction of the gate and the usage class of the gate.
  2. All openings of a horizontal slide gate are guarded or screened from the bottom of the gate to a minimum of 6 feet (1.83 m) above the ground to prevent a 2 ¼ inch (57.2 mm) diameter sphere from passing through the openings anywhere in the gate, and in that portion of the adjacent fence that the gate covers in the open position.
  3. All exposed pinch points are eliminated or guarded.
  4. Guarding is supplied for exposed rollers.
- The operator is intended for installation only on gates used for vehicles. Pedestrians must be supplied with a separate access opening. The pedestrian access opening shall be designed to promote pedestrian usage. Locate the gate such that persons will not come in contact with the vehicular gate during the entire path of travel of the vehicular gate.
- The gate must be installed in a location so that enough clearance is supplied between the gate and adjacent structures when opening and closing to reduce the risk of entrapment. Swinging gates should not open into public access areas.
- The gate must be properly installed and work freely in both directions prior to the installation of the gate operator. Do not over-tighten the operator clutch, pressure relief valve or reduce reversing sensitivity to compensate for a damaged gate.
- For gate operators utilizing Type D protection:
  1. The gate operator controls must be placed so that the user has full view of the gate area when the gate is moving.
  2. A warning placard shall be placed adjacent to the controls.
  3. An automatic closing device (such as a timer, loop sensor, or similar device) shall not be employed.
  4. No other activation device shall be connected.
- Controls intended for user activation must be located at least ten feet (10’) away from any moving part of the gate and where the user is prevented from reaching over, under, around or through the gate to operate the controls. Outdoor or easily accessible controls should have a security feature to prevent unauthorized use.
- The Stop and/or Reset button must be located in the line-of-sight of the gate. Activation of the reset control shall not cause the operator to start.
- A minimum of two (2) WARNING SIGNS shall be installed, one on each side of the gate where easily visible.
- For gate operators utilizing a non-contact sensor:
  1. See the instructions on the placement of non-contact sensors for each type of application.
  2. Care shall be exercised to reduce the risk of nuisance tripping, such as when a vehicle trips the sensor while the gate is still moving in the opening direction.
  3. One or more non-contact sensors shall be located where the risk of entrapment or obstruction exist, such as the perimeter reachable by a moving gate or barrier.
For gate operators utilizing contact sensors:
1. One or more contact sensors shall be located where the risk of entrapment or obstruction exist, such as at the leading edge, trailing edge, and post mounted both inside and outside of a vehicular horizontal slide gate.
2. One or more contact sensors shall be located at the bottom edge of a vehicular vertical lift gate.
3. One or more contact sensors shall be located at the pinch point of a vehicular vertical pivot gate.
4. A hardwired contact sensor shall be located and its wiring arranged so that the communication between the sensor and the gate operator is not subjected to mechanical damage.
5. A wireless contact sensor such as one that transmits radio frequency (RF) signals to the gate operator for entrapment protection functions shall be located where the transmission of the signals are not obstructed or impeded by building structures, natural landscaping or similar obstructions. A wireless contact sensor shall function under the intended end-use conditions.
6. One or more contact sensors shall be located at the bottom edge of a vertical barrier (arm).

Vehicular gate operator products provide convenience and security. However, gate operators must use high levels of force to move gates and most people underestimate the power of these systems and do not realize the potential hazards associated with an incorrectly designed or installed system. These hazards may include:
- Pinch points
- Entrapment areas
- Reach through hazards
- Absence of entrapment protection devices
- Improperly located access controls
- Absence of vehicle protection devices
- Absence of controlled pedestrian access

In addition to these potential hazards, automated vehicular gate systems must be installed in accordance with the UL 325 Safety Standard and the ASTM F2200 Construction Standard. Most lay persons are unaware of, or are not familiar with, these standards. If an automated vehicular gate system is not properly designed, installed, used and maintained, serious injuries or death can result. Be sure that the installer has instructed you on the proper operation of the gate and gate operator system.

Be sure that the installer has trained you about the basic functions of the required reversing systems associated with your gate operating system and how to test them. These include reversing loops, inherent reversing system, electric edges, photoelectric cells, or other external devices.

- This Owner’s Manual is your property. Keep it in a safe place for future reference.
- Be sure that all access control devices are installed a minimum distance of 10 feet away from the gate and gate operator, or in such a way that a person cannot touch the gate or gate operator while using the device. If access control devices are installed in violation of these restrictions, immediately remove the gate operator from service and contact your installing dealer.
- Loops and loop detectors, photo-cells or other equivalent devices must be installed to prevent the gate from closing on vehicular traffic.
- The speed limit for vehicular traffic through the gate area is 5 MPH. Install speed bumps and signs to keep vehicular traffic from speeding through the gate area. Failure to adhere to posted speed limits can result in damage to the gate, gate operator, and to the vehicle.
- Be sure that all persons who will use the gate system are familiar with the proper use of the gate and gate operator and are familiar with the possible hazards associated with the gate system.
- Be sure that warning signs are permanently installed on both sides of the gate in an area where they are fully visible to traffic.
- It is your responsibility to periodically check all entrapment protection devices. If any of these devices are observed to function improperly, remove the operator from service immediately and contact your installing or servicing dealer.
- Follow the recommended maintenance schedule.
- Do not allow children to play in the area of the operator or to play with any gate-operating device.
- To remove the gate operator from service, operate the gate to the full open position and then shut off power to the operator at the service panel.
UL 325 Entrapment Protection

Class I
A vehicular gate operator (or system) intended for use in a home of one-to four single family dwelling, or a garage or parking area associated therewith.

Class II
A vehicular gate operator (or system) intended for use in a commercial location or building such as a multi-family housing unit (five or more single family units) hotel, garages, retail store or other building servicing the general public.

Class III
A vehicular gate operator (or system) intended for use in a industrial location or building such as a factory or loading dock area or other locations not intended to service the general public.

Class IV
A vehicular gate operator (or system) intended for use in a guarded industrial location or building such as an airport security area or other restricted access locations not servicing the general public, in which unauthorized access is prevented via supervision by security personnel.

This table illustrates the entrapment protection requirements for each of the four UL 325 classes.

<table>
<thead>
<tr>
<th>UL 325 Classifications</th>

</tr>
<tr>
<td>Class IV</td>
<td>A, B1, B2 or D</td>
<td>A, B1, B2, D or E</td>
</tr>
</tbody>
</table>

A - Inherent entrapment protection system.
B1 - Provision for connection of, or supplied with, a non-contact sensor (photoelectric sensor or the equivalent).
    When used as the PRIMARY device, must be monitored.
B2 - Provision for connection of, or supplied with, a contact sensor (edge device or the equivalent).
    When used as the PRIMARY device, must be monitored.
C - Inherent adjustable clutch or pressure relief device.
D - Provision for connection of, or supplied with, an actuating device requiring continuous pressure to maintain opening or closing motion of the gate.
E - An inherent audio alarm.
GATE - A moving barrier such as a swinging, sliding, raising, lowering, or the like, barrier, that is a stand-alone passage barrier or is that portion of a wall or fence system that controls entrance and/or egress by persons or vehicles and completes the perimeter of a defined area.

RESIDENTIAL VEHICULAR GATE OPERATOR – CLASS I - A vehicular gate operator (or system) intended for use in a home of one-to four single family dwelling, or garage or parking area associated therewith.

COMMERCIAL / GENERAL ACCESS VEHICULAR GATE OPERATOR - CLASS II - A vehicular gate operator (or system) intended for use in a commercial location or building such as a multi-family housing unit (five or more single family units), hotels, garages, retail store, or other building servicing the general public.

INDUSTRIAL / LIMITED ACCESS VEHICULAR GATE OPERATOR - CLASS III - A vehicular gate operator (or system) intended for use in an industrial location or building such as a factory or loading dock area or other locations not intended to service the general public.

RESTRICTED ACCESS VEHICULAR GATE OPERATOR - CLASS IV - A vehicular gate operator (or system) intended for use in a guarded industrial location or building such as an airport security area or other restricted access locations not servicing the general public, in which unauthorized access is prevented via supervision by security personnel.

VEHICULAR BARRIER (ARM) OPERATOR (OR SYSTEM) - An operator (or system) that controls a cantilever type device (or system), consisting of a mechanical arm or barrier that moves in a vertical arc, intended for vehicular traffic flow at entrances or exits to areas such as parking garages, lots or toll areas.

VEHICULAR HORIZONTAL SLIDE-GATE OPERATOR (OR SYSTEM) - A vehicular gate operator (or system) that controls a gate which slides in a horizontal direction that is intended for use for vehicular entrance and exit to a drive, parking lot, or the like.

VEHICULAR SWING-GATE OPERATOR (OR SYSTEM) - A vehicular gate operator (or system) that controls a gate which moves in an arc in a horizontal plane that is intended for use for vehicular entrance and exit to a drive, parking lot, or the like.

SYSTEM - In the context of these requirements, a system refers to a group of interacting devices intended to perform a common function.

WIRED CONTROL - A control implemented in a form of fixed physical interconnections between the control, the associated devices, and an operator to perform predetermined functions in response to input signals.

WIRELESS CONTROL - A control implemented in means other than fixed physical interconnections (such as radio waves or infrared beams) between the control, the associated devices, and an operator to perform predetermined functions in response to input signals.

INHERENT ENTRAPMENT PROTECTION SYSTEM - A system, examples being a motor current or speed sensing system, which provides protection against entrapment upon sensing an object and is incorporated as a permanent and integral part of the operator.

EXTERNAL ENTRAPMENT PROTECTION DEVICE - A device, examples being an edge sensor, a photoelectric sensor, or similar entrapment protection device, which provides protection against entrapment when activated and is not incorporated as a permanent part of an operator.

ENTRAPMENT - The condition when an object is caught or held in a position that increases the risk of injury.
Swing Gate Requirements

The operator is intended for installation only on gates used for vehicles. Pedestrians must be supplied with a separate access opening. The pedestrian access opening shall be designed to promote pedestrian usage. Locate the gate such that persons will not come in contact with the vehicular gate during the entire path of travel of the vehicular gate. (ref. UL 325 56.8.4.b)

If distance is greater than 4 inches, entrapment protection for this area is required. ASTM F2200 7.1.1.1

If distance is less than 16 inches, entrapment protection in this area is required. ASTM F2200 7.1.1.2

Gates shall have smooth bottom edges, with vertical bottom edged protrusions not exceeding 0.50 inches. ASTM F2200 4.3
Swing Gate Protection

**Reverse Loop**
Minimizes the potential of the gate closing when a vehicle is present. Number and placement of loops is dependent on the application.

**Shadow Loop**
Provides a hold open command to the operator(s) only if the gate(s) are at the full open position.

**Reverse Loop**
Minimizes the potential of the gate closing when a vehicle is present. Number and placement of loops is dependent on the application.

**Automatic Exit Loop**
(Optional) will provide an open command to the gate operator(s) when a vehicle is exiting the property.

**Non-contact Sensor**
Minimizes the potential of the gate closing on vehicular or other traffic that loops cannot sense. See pages 23-24 for typical layout locations.

**Warning Signs**
Permanently mounted and easily visible from either side of the gate.

**Separate Pedestrian Walkway**
Located so pedestrians cannot come in contact with the vehicular gate.

See page 25 for loop information.
SECTION 1 - INSTALLATION

Prior to beginning the installation of the swing gate operator, we suggest that you become familiar with the instructions, illustrations, and wiring guidelines in this manual. This will help ensure that your installation is performed in an efficient and professional manner compliant with UL 325 safety and ASTM F2200 construction standards.

The proper installation of the vehicular swing gate operator is an extremely important and integral part of the overall access control system. Check all local building ordinances and building codes prior to installing this operator. Be sure your installation is in compliance with local codes.

1.1 Underground Conduit Requirements

- The conduit requirements are for a typical slide gate operator installation (the secondary operator is shown for those applications where a secondary operator may be used). The conduit requirements for your application may vary from this depending on your specific needs.
- Use only sweeps for conduit bends. Do not use 90° elbows as this will make wire pulls very difficult and can cause damage to wire insulation.
- DoorKing recommends using 3/4-inch conduit.
- Be sure that all conduits are installed in accordance with local codes.
- Never run low voltage rated wire insulation in the same conduit as high voltage rated wire insulation.

1.2 Concrete Pad

Operator and Conduit Location

Concrete pad MUST be level. Note: Bevel the edges of concrete pad to eliminate water puddling under the operator.

Underground depth of the concrete pad is determined by soil conditions and local building codes. Reinforced concrete recommended.
1.3 Type of Installations

1 Standard Installation
Recommended for all gate lengths opening 90°.

Concrete Pad Location

Concrete Pad

Gate opens in approximately 15 seconds.

Operator Installation

2 Alternate Installation
Recommended for gates up to 14 feet opening 90°.

Concrete Pad Location

Concrete Pad

Gate opens in approximately 12 seconds.

Operator Installation
3 Compact Installation

Recommended for gates **NO LARGER THAN 10 FEET** opening 90°.

4 Gates Opening Wider than 90° Installation

90° Plus Installation requires the Standard Compact Installation’s concrete pad to be moved 2” away from the gate’s open position. This distance of the gate’s arm will vary depending on how far the gate will open.
1.4 Securing Operator to Pad

Permanently attach the operator to the concrete pad using four (4) 3/8” x 3” sleeve anchors (not supplied).

1.5 Attach Gate Bracket

A. Release hub with release tool. **DO NOT REMOVE HUB!**
B. Bolt crank arm to operator.
C. Slide elbow assembly on crank arm.
D. Bolt control arm to gate bracket.
E. Slide control arm into elbow assembly. **KEEP ARM ASSEMBLY LEVEL.**
F. Bolt gate bracket to gate.

Arm assembly and gate bracket **MUST** be level for gate to function correctly.
### 1.6 Determining Arm Lengths

Slide elbow assembly back and forth, manually opening and closing gate until satisfied with the gate’s 90° open and fully closed positions.

Mark and cut off excess arms. Secure arms to elbow assembly with 6 allen screws. Tighten hub and replace release tool. Install safety covers.

### 1.7 Installation of Warning Signs

This DoorKing Swing Gate Operator is shipped with two warning signs. The purpose of the warning sign is to alert uninformed persons, and to remind persons familiar with the gate system, that a possible hazard exists so that appropriate action can be taken to avoid the hazard or to reduce exposure to the hazard. See page 9 for suggested mounting positions of signs.

- Permanently install the supplied warning signs in locations so that the signs are visible by persons on both sides of the gate.
- Use appropriate hardware such as wood or sheet metal screws (not supplied) to install the warning signs.

### SECTION 2 - AC POWER TO OPERATOR(S)

Before attempting to connect any wiring to the operator, be sure that the circuit breaker in the electrical panel is in the OFF position. Permanent wiring must be installed to the operator as required by local electrical codes. It is recommended that a licensed electrical contractor perform this work.

Since building codes vary from city to city, we highly recommend that you check with your local building department prior to installing any permanent wiring to be sure that all wiring to the operator (both high and low voltage) complies with local code requirements.

**THIS GATE OPERATOR MUST BE PROPERLY GROUNDED!!**
### 2.1 High Voltage Wire Run

The distance shown in the chart is measured in Feet from the operator to the power source. If power wiring is greater than the maximum distance shown, it is recommended that a service feeder be installed. When large gauge wire is used, a separate junction box must be installed for the operator connection. The wire table is based on stranded copper wire. The wire run calculations are based on a power source with a 3% voltage drop on the power line, plus an additional 10% reduction in distance to allow for other losses in the system.

This table illustrates the high voltage AC power wire size and distance limitations for a single operator.

<table>
<thead>
<tr>
<th>Model Type</th>
<th>Voltage Required</th>
<th>Amps Required</th>
<th>Wire Size / Max Distance in Feet</th>
</tr>
</thead>
<tbody>
<tr>
<td>6500 1/2 HP</td>
<td>115</td>
<td>5.4</td>
<td>12 AWG 180 10 AWG 290 8 AWG 485 6 AWG 725</td>
</tr>
<tr>
<td>6500 1 HP</td>
<td>115</td>
<td>9.7</td>
<td>12 AWG 100 10 AWG 162 8 AWG 270 6 AWG 405</td>
</tr>
</tbody>
</table>

Reduce the wire distance in half for a primary/secondary dual gate operator application.

Never run low voltage rated wire insulation in the same conduit as high voltage rated wire insulation.

“Optional” High Voltage Kit Installation Note: When installing a high voltage kit for 208/230/460/575 VAC input power, refer to the “high voltage AC power wire size and distance limitations” table on the instruction sheet with the high voltage kit (P/N 2600-266) for AC power wire run limitations.

“Optional” Heater Installation Note: When installing a heater, refer to the “high voltage AC power wire size and distance limitations” table on the instruction sheet with the heater kit for AC power wire run limitations.

### 2.2 High Voltage Terminal Connection

- Route incoming high voltage power through conduit and into the operator as shown.
- Be sure wiring is installed in accordance with local codes. Be sure to color code all wiring.
- It is recommended that a surge suppressor be installed on the high voltage power lines to help protect the operator and circuit board from surges and power fluctuations.
- Secondary operator in a dual operator application gets AC power through the 8-wire interconnection cable that connects the 2 operators together. See next page.

DO NOT cycle the operator without the OPEN and CLOSE limit sensors in their specific open and close positions. The limit sensors or the AC power switch are the only ways to stop the operator once an open cycle has started. This could cause damage to the gate and/or operator if the gate opens too far!
2.3 Bi-Parting Gates Wiring - Dual Gate Operators

Connect the Primary/Secondary operators together with DoorKing’s interconnection cable as shown (Different lengths sold separately P/N 2600-75x). High voltage power and low voltage communications are supplied to the secondary operator by DoorKing’s UL approved cable that is run in a single conduit. Two conduits (High voltage and low voltage) will need to be provided to the secondary operator when NOT using DoorKing’s UL listed, wet environment interconnection cable.

Primary Operator Control Board (4405)
- All loop detector, safety and access control devices are wired to the primary operator.

Interconnection Cable Wiring

Optional Heater Installation Note:
If optional heaters are to be installed on the operators, run two power wires through the interconnection cable conduit to power the secondary operator’s heater. Refer to the instruction sheet with the heater kit for more information.
SECTION 3 - ADJUSTMENTS

The switch settings and adjustments in this chapter should be made after your installation and wiring to the operator(s) is complete. Whenever any of the programming switches on the circuit board are changed, power must be shut-off, and then turned back on for the new setting to take effect.

3.1 4405 Circuit Board Descriptions and Adjustments

**DIP-Switches**
Set the DIP-switches on the circuit board to the desired setting. See switch-settings on next 2 pages.

**Auto-Close Timer**
Auto-close timer (when turned on) SW 1, switch 4.

**Time Delay:**
Adjust from 1 second (full counter-clockwise) to approximately 23 seconds (full clockwise).

**Self-Test Mode**
Self-test mode is for bench checks ONLY! The operator will continually cycle the gate.

**Inherent Reverse Sensors**
Adjust reversing sensitivity for the open AND close direction of the PRIMARY (single) and SECONDARY (dual) operators, See page 21.

**Primary Current Sensor**
Uses a sensing coil with a given number of wire turns through it to monitor the current flow of the primary operator motor.
Factory Set:
1/2 HP Motor - 2 Turns
1 HP Motor - 1 Turn

**Secondary Current Sensor**
Uses a sensing coil with a given number of wire turns through it to monitor the current flow of the secondary gate operator motor.

**How LEDs Function**
Illuminated LEDs indicates that low voltage power is being applied to the circuit board.

**Input LEDs**
Should be OFF and will only illuminate when the input is activated.

**Limit LEDs**
Will only illuminate when the respective limit sensor has been activated.

**Loop LEDs**
Will only illuminate when a reverse, shadow or exit loop is activated (Vehicle passing over a loop).

**Dry Relay Contact**
Terminals 10-11 can be set for Normally Open (NO) or Normally Closed (NC) operation by placing the relay shorting bar on the N.O. or N.C. pins respectively.

**Self-Test Mode**
The operator will continually cycle the gate.

The jumper must be set at normal mode for normal operator function.

**Secondary Current Sensor**
Uses a sensing coil with a given number of wire turns through it to monitor the current flow of the secondary gate operator motor.

**Secondary Interface Terminal Plug**

See page 22.
### 3.2 DIP-Switch Settings for 4405 Circuit Board

The two DIP-switches located on the circuit board are used to program the operator to operate in various modes and to turn on or off various operating features. Whenever a switch setting is changed, power to the operator must be turned OFF and then turned back on for the new setting to take affect. Check and review ALL switch settings prior to applying power to the operator.

3.2 Continued

Switch Definitions

**SW 1 (Top 8 Switches)**

**Typical Settings**

**Switch 1** Must **OPEN** the primary operator’s gate upon initial AC power up and open command. If the **FIRST** open command begins to close the gate, turn AC power off and reverse this switch.

**Switch 2** Must **OPEN** the secondary operator’s gate upon initial AC power up and open command. If the **FIRST** open command begins to close the gate, turn AC power off and reverse this switch. This switch will be set the opposite of switch 1 (e.g. If switch 1 is OFF, then switch 2 will be ON).

**Switch 3** Determines that a device wired to terminal #4 is a normal full open command OR terminal #4 becomes the output from the exit loop detector that is plugged into the EXIT Loop port in the circuit board (Used for specialized functions).

**Switch 4** Turns the auto-close timer on or off. Maximum time that the close timer can be set for is approximately 23 seconds.

**Switch 5** Off setting is Standard Reverse for a **CLOSING** gate. An input to terminal #6 (e.g.: photo beam gets obstructed) AND/OR reverse loops will stop and **reverse** the gate back to the full open position. If the auto-close timer is ON, when gate reaches the open position, timer will **not** close the gate. Another input command is needed to reset and close the gate. **ON** setting allows an input to terminal #6 (e.g.: external loop detector only) to become a SHADOW loop input. It is only active when the gate is in the fully opened position.

**Switch 6** Sets up the circuit board for a single gate operator or primary / secondary (dual) gate operators.

**Switches 7-8** These work in conjunction with each other and determine when the relay on the board will be activated. This relay can be used as a switch for various functions such as illuminating a warning light when the gate is moving, or turning on a green light when the gate is full open. **This relay is not available for these uses if it is being used for the DoorKing Plug-In shadow loop function.**

**SW 2 (Bottom 4 Switches)**

**Typical Settings**

**Switch 1** When the gate overlap is **OFF**, the gate operator(s) will start the open and close cycles at the **same time**. This is the normal setting for a **single** gate operator.

Turning the gate overlap **ON** when using dual gate operators will cause the secondary operator to start the **open** cycle 1.5 seconds **before** the primary operator. The primary operator will start the **close** cycle 1.5 seconds **before** the secondary operator.

**Switch 2** If a magnetic lock is not used with the gate operator, leave this switch in the **OFF** position. Turn this switch ON if a magnetic lock is used and connected to terminals 9 and 12. This applies magnetic lock power and logic to these terminals (NC).

**Switch 3** **MUST** be turned **OFF** for the Model 6500.

**Switch 4** **MUST** be turned **OFF** for the Model 6500.
3.3 Limit Sensors

The hub **must not slip** during operation. Tighten nut to stop any slipping.

**CAUTION**

**DO NOT REMOVE HUB!**

Loosen set screw to adjust the limit sensor.

Magnetic Close Limit Sensor

Magnetic Sensor Activator

Magnetic Open Limit Sensor

Note: If P2 plug is not connected to the circuit board and AC power is turned on, alarm will sound and operator will NOT function.

Limit Sensor LEDs

**Important Limit Sensor Adjustment Note:**

It is very important **NOT** to cycle the gate operator before the limit sensors are in the correct position or it could cause damage to the gate and operator.

**ONLY** turn **ON** AC power. Manually release the gate operator hub with the release tool (See page 31). Physically move the gate to the desired open position. Loosen the set screw on the **OPEN** limit sensor and slowly slide it under the magnetic sensor activator until the **OPEN** limit Sensor LED lights up on the circuit board. Tighten the set screw and repeat this process for the close gate position. Secure the hub with the release tool and cycle the operator a few times and readjust if necessary.

**Release Tool**

**HUB**

**Dual Gate Operators Note:** SW 1, switch 2 will be set the opposite of SW 1, switch 1 (e.g. If switch 1 is OFF, then switch 2 will be ON).
3.4 Inherent Reverse Sensors Adjustment

This vehicular gate operator is equipped with an inherent adjustable reversing sensor (Type A) used as the primary entrapment protection system according to UL 325 standards. The gate will reverse direction after “physically” encountering an obstruction in either the opening or closing gate cycle.

If the Auto-Close Timer (DIP-switch SW 1, switch 4) is ON and the gate physically encounters an obstruction during the CLOSING cycle, it will reverse to the open position and HOLD the gate at this position (Soft shutdown condition). Another input command is needed before the gate will reset and close again.

For the reverse sensors to function correctly, THE HUB MUST NOT SLIP when the gate encounters an obstruction. The gate must be properly installed and work freely in both directions. A good set of roller bearing hinges is essential for proper swing gate operation.

For the reverse system to function correctly, the gate must be properly installed and work freely in both directions and the limit sensors must be properly adjusted BEFORE adjusting the reverse sensors. The ideal adjustment will allow the operator to move the gate through its entire travel cycle without reversing, but will reverse upon contact with an obstruction with no more than 40 Lbs of force. This force can be measured with a gate scale, P/N 2600-225.

CAUTION: Keep pedestrians and vehicles clear of the gate while adjusting and testing sensors!

Note: “Push to Operate” button will use the Auto-Close timer if turned ON (SW 1, switch 4 ON).

1. Press the “Push to Operate” button to OPEN the gate.

2. While gate is opening, slowly rotate the primary reverse sensor clockwise until the LED lights up and the gate reverses direction. Rotate the primary reverse sensor back counter-clockwise approximately 1/8 turn to decrease the sensitivity (LED will turn off).

   Note: The LED will light up during the first seconds of gate travel. Wait until it turns off before adjusting the reverse sensor.

3. Press the “Push to Operate” button and CLOSE the gate. Make sure the gate closes completely. If it reverses and opens (LED will turn on), rotate the primary reverse sensor counter-clockwise a little more to decrease the reverse sensitivity (LED will turn off).

   Cycle the gate a few times to be sure that it cycles completely in both directions, adjusting the primary sensor as necessary.

Dual Operators:
Adjust reverse sensors for each operator when dual operators have been installed.

Note: If the minimum or maximum reverse sensor sensitivity adjustment is reached and the Secondary Operator will not reverse properly, the Secondary Operator Current Sensor’s wire turns will have to be altered.

See 3.5 Secondary Current Sensor Adjustment on the next page.

Test the operator reversing sensitivity:
Place an immobile object along the gate path, allowing the gate to strike it while in the open and close cycles. The gate must reverse direction after striking the object. If it does not, increase the reverse sensitivity and repeat this testing until the correct sensitivity has been achieved in BOTH directions. The operator will assume a soft shutdown (Hold the auto-close timer) after striking and reversing the gate which will require pressing the “Push to Operate” button to cycle the operator again.
3.5 Secondary Current Sensor Adjustment (Dual Gates ONLY)

The PRIMARY gate operator’s “secondary reversing sensor” uses a secondary current sensing device (Located only in the primary operator) to detect any obstructions “physically” encountered in the SECONDARY gate path when using dual gates.

The secondary current sensor uses a sensing coil with a given number of turns through it to monitor the current flow into the secondary operator. Each time the wire passes through the coil, it is considered a turn. The number of turns through the sensing coil is dependant on the operating voltage of the operator and the weight of the gate. In general, light weight gates may require additional turns of wire through the secondary current sensor, while heavier gates may require less turns. **CAUTION – HIGH VOLTAGE:** Be sure power is turned OFF before changing the number of wire turns to the secondary current sensor. When you are setting the secondary reverse sensor (section 3.4 on the previous page) and reach the **MAXIMUM sensitivity** position on the reverse sensor without activating the secondary operator reversing function, add an additional turn of wire through the secondary current sensor. If you set the secondary reverse sensor to the **MINIMUM sensitivity** position and the gate will not cycle completely, reduce the number of turns through the secondary current sensor.

---

**Typical Number of Turns for Secondary Current Sensor**

- **1 Turn**: To AC power terminal.
- **2 Turns**: To AC power terminal.
SECTION 4 - ENTRAPMENT AND SAFETY PROTECTION

Secondary Entrapment Protection Device:
In addition to the inherent reversing sensor system, the Model 6500 has a 6-pin UL 325 terminal for the connection of photo sensors-Type B1 secondary entrapment protection device required by UL 325 standards. Entrapment protection devices must be installed to reduce the risk of injury. Install these devices where the risk of entrapment or a hazard exists while the gate is moving. Specific installations will vary.

4.1 UL 325 Terminal Description

6-Pin UL 325 Terminal
Secondary Entrapment Protection Device Connection

1 OPEN Entrapment Sensor (Photo Sensor): Obstructed opening-direction photo beam will STOP the gate during the opening-direction only. Gate will resume the open cycle when the obstructed photo beam has been cleared.

Entrapment Protection Device Note:
Specific gate installations may require more entrapment protection devices than are shown here. Install them where necessary to protect against ANY potential entrapment or hazard area.

2 CLOSE Entrapment Sensor (Photo Sensor): Obstructed closing-direction photo beam will STOP the gate during the closing-direction only. Gate will resume the close cycle when the obstructed photo beam has been cleared. Note: The closing-direction photo sensor typically should REVERSE the gate when the photo beam gets obstructed. See the next page for “Reverse” closing-direction option.

3 Three 115 VAC Convenience Outlets

5 & 6 Low Voltage Common: Common terminals for all the secondary entrapment protection device inputs.

Note: The 6-pin terminal can be unplugged from circuit board for easy wire connections. All inputs are normally open (NO).
4.2 Entrapment and Safety Protection Device Locations

Typical UL Photo Sensor mounting height and distance away from gate.

Closing-Direction Photo Sensors

Opening-Direction Photo Sensors

If this space is less than 16 inches, secondary entrapment protection is required in this area.

Photo Sensors Sample Setup

This diagram is for illustration purposes. The actual placement of the protection devices is dependent on the specific installation requirements.

"Reverse" Closing-Direction Option

IF the closing-direction photo sensor is wired to the #6 main terminal, a closing-direction photo beam that gets obstructed will REVERSE the gate back to the open position (Typical).

IF the closing-direction photo sensor is wired to the UL 325 terminal #2, a closing-direction photo beam that gets obstructed will STOP the gate then resume closing the gate when the obstructed photo beam has been cleared (Typically not used).

Photo Sensor Power Note: Photo sensors can be powered by the built-in convenience outlets located on the operator (See previous page).
4.3 Loop Detector Wiring

To help protect the operator from accidentally closing on vehicles in the gate’s path, DoorKing highly recommends that loops and loop detectors be installed. Loops are laid underneath, cut into asphalt or concrete driveways or buried beneath gravel and earth driveways. A loop detection system will sense a vehicle like a metal detector and send a signal to the gate operator preventing the gate from automatically opening or closing on a vehicle when it is in the gate’s path. DoorKing recommends that a licensed installer perform this work.

Automatic Exit Loop
Automatically opens the gate for exiting vehicles without having to use a transmitter or keypad. The exit loop can be placed a minimum of 4 feet away from the reverse loop or far enough away from the gate so the gate has started opening or even completely opened by the time you drive up to it (Free exit).

Shadow Loop will ONLY HOLD the main gates in the Full Open Position when a vehicle is on the shadow loop. However, it WILL NOT stop or reverse the main gates once they start to close.

Reverse Loops are placed on each side of the gate to prevent the gate from closing on a vehicle in the gate’s path. They will stop or reverse the cycling of the gate while a vehicle is in or near the gate’s pathway.

- Loop detector wiring is shown for DoorKing plug-in loop detectors. If other loop detectors are used, refer to the installation instructions supplied with those detectors for wiring instructions.
- If other detectors are used, use a separate power supply to power these detectors.
- Loop layout shown is for a typical swing gate application with two-way traffic, or one-way exit only traffic.

DoorKing offers a free “Loop and Loop-Detectors Information Manual” PDF located at DoorKing’s web site for more information. www.dkaccess.com
SECTION 5 - MAIN TERMINAL WIRING

5.1 Terminal Descriptions

4-Pin Non-Removable Terminal

Notes:
- Use a standard 4-wire 3-button control station. DoorKing’s 3-wire 3-button control station cannot be used.
- When using a 3-button control station AND a interlock device together, #3 terminal (N.O.) must be wired in series.
- See next page for wiring.

20-Pin Main Terminal

- Low Voltage Common
- Full Open
- 24 VAC - 250 ma max.
- Full Open
- Full Open
- Standard Reverse
- Gate Tracker Data
- Gate Tracker Busy
- 24 VDC Mag Lock Power
- Dry Relay Contact
- Dry Relay Contact
- Low Voltage Common
- Low Voltage Common
- Entrapment Alarm
- Alarm Reset
- Secondary Current Sensor

Notes:
- Jumper on bottom 2 pins when using 4-pin terminal.
- Jumper on top 2 pins when NOT using 4-pin terminal.

24-volt DC magnetic lock power is provided constantly except when the gate is opening or open (Normally Closed function). 1 Amp Max.

Operation of the circuit board dry relay contact is dependent on setting of SW 1, switches 7 and 8. Relay contacts can be set for Normally Open (NO) or Normally Closed (NC) operation.

Contact rating is 1 amp maximum at 24-volts DC.

Doorking’s Remote alarm reset station can be connected. See next page for wiring. It MUST be mounted in the line-of-sight of the gate operator. (DKS P/N 1404-080)

For dual operator applications ONLY. Allows the secondary reversing sensor to monitor the current flow into the secondary operator. See page 22 for more information.

- If SW 1, switch 3 is ON, functions as a normal full open input (Normal setting).
- If SW 1, switch 3 is OFF, input to terminal #4 becomes the output from the EXIT loop detector plugged into the EXIT loop port. (Used for specialized functions).
- When gate is closed, input will open gate.
- When gate is open and auto close timer SW 1, switch 4 is turned ON, input will re-set and hold timer.
- When gate is open and auto close timer SW 1, switch 4 is turned OFF, input will close gate.
- When gate is closing, input will reverse gate.
- When gate is closing: SW 1, switch 5 is OFF, an input to terminal #6 (e.g.: photo beam gets obstructed) will stop and reverse and the gate to the full open position.
- Note: If the auto-close timer is ON, when gate reaches the open position, timer will not close the gate. Another input command is needed to reset and close the gate (Normal Setting).
- SW 1, switch 5 ON, an input to terminal #6 (e.g.: external loop detector connected) becomes a SHADOW loop input. It is only active when the gate is fully opened.

Use a standard 4-wire 3-button control station. DoorKing’s 3-wire 3-button control station cannot be used.

When using a 3-button control station AND a interlock device together, #3 terminal (N.O.) must be wired in series.

See next page for wiring.
**Important:** Controls must be installed a minimum of 10-feet from the gate or installed in such a way that the person using the control cannot come in contact with the gate or gate operator.

**Gate Tracker** - DoorKing Access Control System (Model 1833, 1835, 1837 or 1838) tracker system can be connected. This system can keep track of gate operator cycle count, shorted inputs, loop detector problems, any forced entry attempts, if the gate has struck anything during the open or close cycle, power interruptions, etc. For more detailed information refer to the Tracker Installation and Wiring Manual, DoorKing P/N 2351-010.

Terminal #2 (Full open) required only if the tracker board will activate the gate operator. Refer to the manual 2351-065 for detailed information.
SECTION 6 - OPERATING INSTRUCTIONS

IMPORTANT SAFETY INSTRUCTIONS

WARNING - To reduce the risk of injury or death:

1. READ AND FOLLOW ALL INSTRUCTIONS.
2. Never let children operate or play with gate controls. Keep the remote control away from children.
3. Always keep people and objects away from gate. NO ONE SHOULD CROSS THE PATH OF THE MOVING GATE.
4. Test the operator monthly. The gate MUST reverse on contact with a rigid object or stop or reverse when an object activates the non-contact sensors. After adjusting the force or the limit of travel, retest the gate operator. Failure to adjust and retest the gate operator properly can increase the risk of injury or death.
5. Use the emergency release only when the gate is not moving and power has been shut-off.
6. KEEP GATES PROPERLY MAINTAINED. Read the owner’s manual. Have a qualified service person make repairs to gate hardware.
7. The entrance is for vehicles only. Pedestrians must use separate entrance.
8. SAVE THESE INSTRUCTIONS.

6.1 Power and Reset Switches

Unlock the power switch cover and open to access the MAIN POWER, DC POWER and the operator RESET switch.

- **Reset Switch** - Used to turn off the entrapment alarm and to reset the operator after a hard shutdown has occurred.
- **Alarm Siren**
- **AC Power Switch** - Powers the operator ON (toggle up) or OFF (toggle down).
- **DC Power Switch** - Turns the DC system power ON (toggle up) or OFF (toggle down).

This switch is only installed on model 6500 operators with the DC convenience open system installed (See pages 32-33).
6.2 Shutdown Conditions

Under various entrapment conditions the operator will assume either a soft or hard (alarm) shutdown. To determine what type of reset action is required, you will need to understand how the different entrapment conditions affect the gate operator.

Soft Shutdown

This occurs in various situations where the inherent or secondary entrapment protection devices have been activated. In a soft shutdown condition, the operator will not respond to any input that was present when the entrapment protection device sensed an obstruction. If the gate stops at the open position, the operator will not respond to the automatic close timer.

- **Example 1** - A time clock keys the gate open in the morning and an entrapment protection device senses an obstruction prior to the gate reaching the full open position. If the entrapment is sensed by the inherent system, the gate will reverse and run back to the closed position. The time clock input is still present, but the gate will not re-open.

NOTE: In some systems, the time clock input comes from the telephone entry system relay. This same relay may also provide open commands for a card reader, MicroPLUS transmitters and the visitor telephone entry. If so, these devices will also be disabled in a soft shutdown condition.

- **Example 2** - If the gate is closing and an entrapment protection device is activated, the gate will either stop or reverse and run back to the open position, depending upon if the secondary or inherent device was activated. The automatic close timer will not close the gate.

- **Example 3** - Vehicle arrives at open loop and gate runs towards the open position. The inherent entrapment protection is activated. The gate reverses and runs back to the closed position. If the vehicle is still present at the open loop a soft shutdown condition does not occur. The loop input provides an immediate reset of the operator and the gate will again run to the open position.

Resetting a Soft Shutdown

In some conditions, a soft shutdown will reset as soon as the entrapment condition clears. For example, if a non-contact sensor (photo sensor) is sensing an obstruction, the operator will stop the gate and assume a soft shutdown condition. When the photocell clears, the operator will return to normal operation.

When the operator is in a soft shutdown, activation of any 'intended input' will reset the operator. An 'intended input' includes any command, any standard safety input and any loop input. Activating any of these inputs will reset the gate. At that point the gate will return to normal operation. If the gate is open, the automatic close timer will then time out and close the gate.

Hard Shutdown (Alarm Activated)

A hard shutdown condition occurs when the inherent entrapment protection system has sensed **TWO** consecutive obstructions before the gate reaches the full open or closed position.

- **Example** - The gate is closing and the inherent entrapment protection system senses an obstruction and causes the gate to reverse direction. As the gate begins to run in the open direction, a second obstruction is sensed prior to the gate reaching the full open position. Once the second obstruction has been sensed, the operator will stop, the audio alarm will be activated and all standard inputs are shut down (including open commands, safety commands, loop inputs, etc.).

The audio alarm will sound for five minutes, or until the operator’s reset button is pushed. After (5) five minutes the alarm will “chirp every 5 sec.” and the hard shutdown condition will remain in affect until the reset button is pushed.

- After 5 minutes, the audio alarm will “chirp” every 5 seconds. This indicates that the operator is in a hard shutdown condition and the reset switch must be activated to reset the operator and silence the alarm.

Continued on the next page
6.3 Manual Gate Operation

This operator is equipped with a manual release system that will allow the gate to be pushed open in the event of a power outage or equipment failure. NEVER remove the hub from the operator after manually releasing it.

- Before resetting a hard shutdown, determine why the shutdown occurred. Inspect the gate for any obstructions along its path that could have activated the inherent entrapment sensing system. Inspect the gate and gate hardware.

NOTE: DoorKing operators have a built-in alarm reset push button mounted on the operator above the power ON-OFF toggle switch. Activating this button will return the gate operator to normal operation, but will not activate the gate operator.

Once the gate has been reset, an open or close command is needed to start the gate operator. Most activating commands will cause the gate operator to cycle to the open position. This includes activation of a key switch or open command and activation of the automatic exit loop. Activation of a close command will run the gate to the closed position.

Resetting a Hard Shutdown

When the operator is in a hard shutdown condition (audio alarm activated or audio alarm “chirps” every 5 seconds), the only way to reset the gate operator and return it to normal operation is to activate the alarm reset input (auxiliary terminals 2 and 3). An alarm-reset switch can be mounted external of the gate operator provided that it is installed in the line of sight of the gate and gate operator.

- Before resetting a hard shutdown, determine why the shutdown occurred. Inspect the gate for any obstructions along its path that could have activated the inherent entrapment sensing system. Inspect the gate and gate hardware.

NOTE: DoorKing operators have a built-in alarm reset push button mounted on the operator above the power ON-OFF toggle switch. Activating this button will return the gate operator to normal operation, but will not activate the gate operator.

Once the gate has been reset, an open or close command is needed to start the gate operator. Most activating commands will cause the gate operator to cycle to the open position. This includes activation of a key switch or open command and activation of the automatic exit loop. Activation of a close command will run the gate to the closed position.

Emergency Vehicle Access Conditions

The automatic vehicular gate system must be designed to allow access to emergency vehicles under different operating conditions.

1. During normal powered operation, emergency vehicles access the gate by use of the Emergency Vehicle Access Device installed on your gate system. The type of device that is used in your community is dependent on your city codes. These devices may include (but are not limited to) Fire Department lock boxes, Click-2-Enter radio receivers, strobe light sensors, siren sensors, etc.

2. In the event of a power failure, the emergency vehicle access device may not be functional because the gate operator is un-powered. If the gate operator is equipped with a Convenience Open System, this system will automatically open the gate when primary (AC) power is removed. NOTE: DC convenience open systems are optional and your gate system may or may not be equipped with one. Check with your installer to determine if your gate system is equipped with a convenience open system.

3. In the event of a primary (AC) power failure and a back-up system (DC) power failure (low charged or dead batteries for example), the system must have a release system to allow the gate to be Manually Operated (See next page).
Manual Release

A Unlock the cover and rotate sliding door.

B Remove release tool and place where shown.

C Release hub. Gate can now be manually operated.

Never attempt to manually push open any gate with an operator attached to it until you have verified that power to the operator has been shut-off.

CAUTION
DO NOT REMOVE HUB!
SECTION 7 - OPTIONAL CONVENIENCE OPEN ADJUSTMENTS

The optional convenience open system installed in your vehicular gate operator is designed as a convenience enhancement only. It is not designed or intended to provide continuous gate operation during a power outage. Its sole purpose is to provide a method to open the vehicular gate to allow unimpeded traffic flow when the gate and access control system is without power.

If your access control system requires 100% power backup and continuous operation when primary (AC) power has failed, a power inverter / backup system, such as DoorKing Models 1000 or 2000, is required.

- The convenience open system cannot provide continuous gate operation during a power outage.

- This system automatically cycles the gate to the open position ONE TIME ONLY after AC power failure.

- The convenience open system requires testing on a monthly basis to insure the batteries are fully charged and that the system is operational.

- The convenience open system uses two 12-volt, 3.0 amp-hour gel-cell batteries. These batteries should be replaced every two years on average, or sooner if required.

- Batteries are affected by temperature. Cold temperatures will reduce the effectiveness of the batteries. High temperatures will result in a shortened battery life.

- Batteries are not covered under warranty.

7.1 Operating Mode

This convenience open system consist of a control board (2340-010), motor and power supply (batteries) providing a completely redundant drive system to open the gate should a power outage occur. This system is not designed to maintain continuous gate operation; rather it provides a convenient method to open a gate ONCE during adverse conditions. If continuous gate and access control system operation is required, refer to the DoorKing Model 1000 or 2000 Inverter / Backup Power Systems.

Automatic Mode after loss of AC Power, Switch 1 ON

The system will automatically open the gate approximately 3 seconds after loss of AC power. Automatic mode is always used for gates in general access applications such as gated communities, apartment complexes, etc. DO NOT set Switch 1 in the OFF position.

Restart Options after AC Power is Restored, Switch 3

Once AC power is restored, the system’s control board can be set to “automatically re-key” the gate operator (switch 3 ON) to establish normal operation, or can be set to require a “manual input” (switch 3 OFF) before the operator resumes normal operation.
### 7.2 DC System Description

Gate will automatically OPEN and stay open during an AC power failure. DIP-Switch 3 setting will determine how operator will return to normal operation AFTER AC power has been restored.

6500-065-W-3-14
SECTION 8 - MAINTENANCE AND TROUBLESHOOTING

Inspection and service of this gate operator by a qualified technician should be performed anytime a malfunction is observed or suspected. High cycle usage may require more frequent service checks.

8.1 Maintenance

When servicing the gate operator, always check any secondary (external) reversing devices (loops, photo eyes, etc.) for proper operation. If external reversing devices cannot be made operable, do not place this operator in service until the malfunction can be identified and corrected.

Always check the inherent reversing system when performing any maintenance. If the inherent reversing system cannot be made operable, remove this operator from service until the cause of the malfunction is identified and corrected. Keeping this operator in service when the inherent reversing system is malfunctioning creates a hazard for persons which can result in serious injury or death should they become entrapped in the gate.

When servicing this gate operator, always turn power OFF!!

If gearbox requires oil, use only Mobil SYNTHETIC SHC-629 Oil. Do not completely fill gearbox with oil. Gearbox should be half full only. Do not exceed this level.

8.2 Troubleshooting

Have a good VOM meter to check voltages and continuity. A Meg-Ohm meter capable of checking up to 500 meg-ohms of resistance is necessary to properly check the integrity of the ground loops. When a malfunction occurs, isolate the problem to one of three areas: 1) the operator, 2) the loop system, 3) the keying devices. **Use caution when checking high voltage areas: terminals 17 through 20, the motor capacitor and the motor.**

1. Check the input indicator LEDs. They should only come ON when a keying device (card reader, push button, etc.) is activated. If any of the input LEDs are ON continuously, this will cause the gate operator to hold open. Disconnect the keying devices one at a time until the LED goes OFF.

2. Check any external secondary entrapment protection devices. Any short or malfunction in these devices can cause the gate operator to stop or to hold open.

3. A malfunction in a loop or loop detector can cause the gate operator to hold open, or to not detect a vehicle when it is present over the loop. The LEDs next to the loop detector ports on the operator circuit board will light only when the loop has detected an object above it. If the LEDs stays on after the object has gone, then the loop detector has malfunctioned. Pull the loop detector circuit boards from the loop ports on the operator circuit board. If the malfunction persists, the problem is not with the loop system. For more information on trouble shooting loops and loop detectors, refer to your loop detector instruction sheet and to the DoorKing Loop and Loop Detector Information Manual.

4. Check to be sure that there are no shorted or open control wires from the keying devices to the gate operator. If a keying device fails to open the gate, momentarily jumper across terminals 1 and 2 (or 1 and 5) on the gate operator circuit board. If the gate operator starts, this indicates that a problem exist with the keying device and is not with the gate operator.

5. Check the high voltage supply. A voltage drop on the supply line (usually caused by using too small supply voltage wires) will cause the operator to malfunction. Refer to the wire size chart in section 2.1 page 15.

<th>Possible Solution(s)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Operator will not run. Power LED is OFF</td>
<td>• Check that power to the operator is turned ON.</td>
</tr>
<tr>
<td></td>
<td>• Transformer may be overheated. Turn power off and allow board to cool for several minutes then retest. Check for low 115 VAC power and low voltage shorts.</td>
</tr>
<tr>
<td></td>
<td>• Check for 115 VAC at terminals 19 and 20. If voltage measures OK, check the terminal strip or replace the circuit board.</td>
</tr>
<tr>
<td>Operator will not run. Power LED is ON</td>
<td>• Push test button or momentarily jumper terminal 1 to terminal 2 (or 1 to 5). If the input LED does not come ON, check the terminal strip or replace the circuit board. If LED does come ON, proceed to next steps.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Check Motor:</strong></td>
</tr>
<tr>
<td></td>
<td>Remove circuit board. With power ON, momentarily jumper terminal 19 to terminal 18 with a 14 AWG insulated jumper wire. <strong>CAUTION – HIGH VOLTAGE.</strong> The motor should run.</td>
</tr>
<tr>
<td></td>
<td>With power ON, momentarily jumper terminal 19 to terminal 17 with a 14 AWG insulated jumper wire. <strong>CAUTION – HIGH VOLTAGE.</strong> The motor should run in the opposite direction of the above step.</td>
</tr>
<tr>
<td></td>
<td>If the motor runs in both steps above, replace the control board. If the motor does not run, or runs in only one direction, problem can be a bad motor, motor capacitor, wire connections from the control board to the motor or a bad control board.</td>
</tr>
<tr>
<td>Secondary operator motor will not run.</td>
<td>• Check that SW-1, switch 6 is ON.</td>
</tr>
<tr>
<td></td>
<td>• Remove circuit board. Momentarily jumper terminal 19 to the primary/secondary connection terminal block terminal 1, then to terminal 2 with a 14 AWG insulated jumper wire. <strong>CAUTION – HIGH VOLTAGE.</strong> The secondary motor should run one way, then the other way as power is applied to each terminal.</td>
</tr>
<tr>
<td></td>
<td>• If the secondary motor runs in both directions, replace the control board. If secondary motor does not run, or runs in only one direction, problem can be in the wiring from the primary to secondary operator, bad secondary motor or motor capacitor.</td>
</tr>

<tr>
<td></td>
<td>device.  If LED does not light, replace control board.</td>
</tr>
<tr>
<td></td>
<td>• Check motor as described on previous page.</td>
</tr>
<tr>
<td>Gate starts to close, then reverses to open.</td>
<td>• Check that the reverse sensitivity is properly adjusted.</td>
</tr>
<tr>
<td></td>
<td>• Disconnect the gate from the operator and check that the gate operates freely without any binding.</td>
</tr>
<tr>
<td></td>
<td>• Check the loop detector LEDs and input LEDs.  Any that flash ON will cause the gate to reverse.</td>
</tr>
<tr>
<td></td>
<td>• If a shadow loop is used, check for proper wiring.  A mis-wired shadow loop detector will cause the gate</td>
</tr>
<tr>
<td></td>
<td>to reverse.</td>
</tr>
<tr>
<td></td>
<td>• Continue troubleshooting or replace the circuit board.</td>
</tr>
<tr>
<td>Gate closes and then re-opens.</td>
<td>• Check for any input or loop detector LEDs that are ON.</td>
</tr>
<tr>
<td></td>
<td>• Check that operator is running in the proper direction (see “Gate closes but will not open” above).</td>
</tr>
<tr>
<td>Alarm sounds for 5 minutes and then beeps once every 5 seconds. Operator will not run.</td>
<td>• Operator is in a “hard shutdown” condition.  Reset switch must be activated to return operator to normal operation.</td>
</tr>
<tr>
<td>DC open system will not open gate upon AC power outage.</td>
<td>• Check if the DC system is set to open gate automatically or requires an input to open.</td>
</tr>
<tr>
<td></td>
<td>• Check that the DC system power switch is in the ON position.</td>
</tr>
<tr>
<td></td>
<td>• Check the batteries for proper voltage.  Replace if necessary.</td>
</tr>
<tr>
<td></td>
<td>• Replace the DC system circuit board.</td>
</tr>
</tbody>
</table>
8.3 Built-in Diagnostics

This gate operator is designed with built-in diagnostics that will alert you to potential or existing problems that the microprocessor has detected. Specific fault conditions are checked and the operator will signal that a fault exist through the built-in alarm.

**Constant tone is heard when power is applied:** This indicates that the limit switch wire harness is not connected to the circuit board. In this condition, the operator will not run and the tone will continue until the fault is corrected. Check to be sure that the limit switch plug is properly inserted into P2.

**Constant tone is heard:** This indicates that the operator is in a hard shutdown condition. The tone will continue to sound for five minutes, and then will beep once every five seconds. The operator-reset button must be pressed or power must be removed and then reapplied to return the operator to normal operation.

**Short tone is heard every five seconds:** This indicates that the operator has been in a hard shutdown condition in excess of five minutes. This will continue until the operator-reset button is pressed or until power is removed from the operator.

**Operator runs for 1 second and stops, two short tones are heard:** This indicates that there may be a fault with the current sensor circuit. Check that the black current sensor wire has been passed through the hole in the current sensor donut with the correct number of loops (1/2 HP motor - 2 loops, 1 HP motor - 1 loop).
8.4 Accessory Items

The following accessory items are available for the model 6500 swing gate operator.  

Contact Sensors - For use as a secondary entrapment protection device. Miller Edge, Inc., MGO20, MGR20, MGS20

Photo Cell - Non-contact (photo-cells) sensors for use as a secondary entrapment protection device.

Gate Scale - Use to test torque required to move gate. P/N 2600-225

Speed Bumps - Prefabricated six-foot speed bump reduces traffic speed through gate system. P/N 1610-150
### 8.5 Gearbox Shaft Extension Replacement

**Crank Arm Only** P/N 6500-255  
**Control Arm Only** P/N 2600-714  
**Complete Arm Kit** P/N 6500-430

**Hub Assembly**  
Remove the **TWO** allen screws on bottom of hub to remove the complete hub assembly.

**Limit Sensors Collar** P/N 6500-115

**Brass Bushing 1 1/8” ID** P/N 6500-135

**Gearbox Shaft Extension with 4 Keys** P/N 6500-147

**Stainless Steel Washer** P/N 2620-075  
**Snap Ring** P/N 2630-007

**Gearbox Collar** P/N 6500-146  
Remove the **FOUR** allen screws to remove the gearbox collar.

**Limit Sensor Assemblies**  
Loosen set screws on plastic limit assemblies to remove them. Be **CAREFUL** not to damage limit sensor wires after the assemblies have been removed.  
**Note:** Close Limit Sensor assembly must be reinstalled on **TOP** of Open Limit Sensor assembly.
