Entrapment Protection must be provided for the gate system where the risk of entrapment or obstruction exists. The operator will not run without one or more monitored type B1 or B2 entrapment protection devices.

QUICK GUIDE: Terminal Descriptions

UL 325/3 Button 10-Pin Terminal

3 Button Station
- Use a standard 4-wire 3-button control station.
- DoorKing’s 3-wire 3-button control station cannot be used.
- When using a 3-button control station, the 3-pin jumper MUST be set to ON.
- See page 26 for wiring.

Main Terminal #3 Note:
Exceeding 250 mA of power from this terminal may cause the circuit board transformer to overheat, causing intermittent problems.

- If SW 1, switch 3 is ON, functions as a normal full open input (Normal setting).
- If SW 1, switch 3 is OFF, input to terminal #4 becomes the output from the EXIT loop detector plugged into the EXIT loop port. (Used for specialized functions).

This input ONLY functions when gate is fully opened or in the closing cycle.
- SW 1, switch 4 MUST be OFF. SW 2, switch 4 MUST be OFF. When gate is closing, an input to main terminal 10 (eg: photo beam gets blocked) will reverse and open the gate. Note: If the auto-close timer is ON, when gate reaches the open position, timer will time out and close the gate.
- DO NOT turn SW 1, switch 4 ON.
- DO NOT turn SW 2, switch 4 ON.

Note: Main terminal 10 is not available for a photo sensor when using a SHADOW LOOP. See page 28 about shadow loop connection.

1. Low Voltage Common

14. Relay
15. Low Voltage Common
16. Bi-Parting
17. Bi-Parting Common
18. Tracker Data
19. Tracker In
20. Magnlock

Connects to a DoorKing Tracker Expansion Board. Data will be reported about this gate operator's SPECIFIC activity to a DoorKing access control system. A list of the events will be "Track"ed and stored in the access control system.

Bi-Parting Gates ONLY. Connect the secondary gate operator terminals 16-17-18 to this primary terminal 16-17-18 respectively.

16 and 17 MUST be twisted together when NOT using included RS-485 cable.

Primary operator is determined by pressing its KEY SWITCH FIRST after powering up operators. This establishes Primary/Secondary operator order.
SPECIFICATIONS FOR MODEL 6524-080

Use this manual for the Model 6524 operator with circuit board 4100-010 Rev AA or higher ONLY.

Class of Operation: UL 325 Class I, II, III, IV
Type of Gate: Vehicular Swing Gate Only
Motor: Quadra Drive DC Motor
Power Input: Volts@Amps: 115 VAC @ 1.8 Amps OR 230 VAC @ 0.9 Amps
Batteries: Two 12 Volt, 7.2 A/Hr (Standard) OR Two 12 Volt, 18 A/Hr (Optional)

Maximum Gate Cycles:
- AC Power: Continuous
- Battery Power - 12 Volt, 7.2 A/Hr (Standard): 40 Cycles
- Battery Power - 12 Volt, 18 A/Hr (Optional): 150 Cycles

Battery Power Note: The number of gate cycles when using ONLY battery power WILL vary depending on gate weight, gate length, operating condition of gate hardware, temperature and amount of charge in batteries.

Gate Speed: 12-14 Sec
Max Gate Weight: 600 lbs - 272 Kgs
Max Gate Length: 18 Ft - 5.4 Meters
Inherent Entrapment Protection Device: Inherent Reverse Sensor System (Type A)
External Entrapment Protection Device Inputs:
- Connection inputs for Non-contact Sensor - Photo Sensor (Type B1)
- Connection input for Contact Sensor - Reversing Edge (Type B2)

Entrapment Protection must be provided for the gate system where the risk of entrapment or obstruction exists. The operator will not run without one or more monitored type B1 or B2 entrapment protection devices.

STANDARD BATTERY
12 Volt 7.2 Amp/Hr Standard Replacement Battery
P/N 1801-003, Two (2) required.

OPTIONAL BATTERY
12 Volt 18 Amp/Hr Battery for Extended Back-Up Power
P/N 1801-004, Two (2) required.

- 7.2 Manual Gate Operation  41
- 7.3 Gate Operators Monthly Checkup  42
- Printable Safety Page  43
**Swing Gate Requirements**

The operator is intended for installation only on gates used for vehicles. Pedestrians must be supplied with a separate access opening. The pedestrian access opening shall be designed to promote pedestrian usage. Locate the gate such that persons will not come in contact with the vehicular gate during the entire path of travel of the vehicular gate.

- **A** If distance is greater than 4 inches, entrapment protection is required for this area.
- **B** If distance is less than 16 inches, entrapment protection is required for this area.

With the hinge mounted on the corner of the pilaster, the entrapment area **A** is eliminated and protection is NOT required for this area.

Gates shall have smooth bottom edges, with vertical bottom edged protrusions not exceeding 0.50 inches.

If bottom of gate is 6” to 16” above the ground at any part of the gate’s traveling path, entrapment protection for this area is required.
Swing Gate Protection

**Reverse Loop**
Minimizes the potential of the gate closing when a vehicle is present. Number and placement of loops is dependent on the application.

**Shadow Loop**
Provides a hold open command to the operator(s) only if the gate(s) are at the full open position.

**Non-contact Sensor**
Minimizes the potential of the gate closing on vehicular or other traffic that loops cannot sense. Monitored device helps protect against entrapment when needed.

**Warning Signs**
Permanently mounted and easily visible from either side of the gate.

**Non-contact Sensor**
Minimizes the potential of the gate striking vehicular or other traffic that loops cannot sense. Monitored device helps protect against entrapment when needed.

**Contact Sensor**
Minimizes the potential of the gate striking vehicular or other traffic that loops cannot sense. Monitored device helps protect against entrapment when needed.

**Automatic Exit Loop**
(Optional) will provide an open command to the gate operator(s) when a vehicle is exiting the property.

**Reverse Loop**
Minimizes the potential of the gate closing when a vehicle is present. Number and placement of loops is dependent on the application.

**Separate Pedestrian Walkway**
Located so pedestrians cannot come in contact with the vehicular gate.

**Automatic Exit Loop**
(Optional) will provide an open command to the gate operator(s) when a vehicle is exiting the property.

**Contact Sensor**
Minimizes the potential of the gate striking vehicular or other traffic that loops cannot sense. Monitored device helps protect against entrapment when needed.

**Warning Signs**
Permanently mounted and easily visible from either side of the gate.

**Non-contact Sensor**
Minimizes the potential of the gate closing on vehicular or other traffic that loops cannot sense. Monitored device helps protect against entrapment when needed.
**ASTM F2200 Standard for Gate Construction**

Vehicular gates should be constructed and installed in accordance with ASTM F2200; Standard Specification for Automated Vehicular Gate Construction. For a copy of this standard, contact ASTM directly at 610-832-9585; service@astm.org; or www.astm.org.

**Important Safety Instructions**

**WARNING - To reduce the risk of injury or death:**

1. **READ AND FOLLOW ALL INSTRUCTIONS.**
2. Never let children operate or play with gate controls. Keep the remote control away from children.
3. Always keep people and objects away from gate. **NO ONE SHOULD CROSS THE PATH OF THE MOVING GATE.**
4. Test the operator monthly. The gate MUST reverse on contact with a rigid object or stop or reverse when an object activates the non-contact sensors. After adjusting the force or the limit of travel, retest the gate operator. Failure to adjust and retest the gate operator properly can increase the risk of injury or death.
5. Use the emergency release only when the gate is not moving.
6. **KEEP GATES PROPERLY MAINTAINED.** Read the owner’s manual. Have a qualified service person make repairs to gate hardware.
7. The entrance is for vehicles only. Pedestrians must use separate entrance.
8. **SAVE THESE INSTRUCTIONS!**

**Instructions regarding intended installation:**

- Install the gate operator only if:
  1. The operator is appropriate for the construction of the gate and the usage class of the gate.
  2. All openings of a horizontal slide gate are guarded or screened from the bottom of the gate to a minimum of 6 feet (1.83 m) above the ground to prevent a 2 ¼ inch (57.2 mm) diameter sphere from passing through the openings anywhere in the gate, and in that portion of the adjacent fence that the gate covers in the open position.
  3. All exposed pinch points are eliminated or guarded.
  4. Guarding is supplied for exposed rollers.

- The operator is intended for installation only on gates used for vehicles. Pedestrians must be supplied with a separate access opening. The pedestrian access opening shall be designed to promote pedestrian usage. Locate the gate such that persons will not come in contact with the vehicular gate during the entire path of travel of the vehicular gate.

- The operator must be installed in a location so that enough clearance is supplied between the gate and adjacent structures when opening and closing to reduce the risk of entrapment. Swinging gates should not open into public access areas.

- The operator must be properly installed and work freely in both directions prior to the installation of the gate operator. Do not over-tighten the operator clutch, pressure relief valve or reduce reversing sensitivity to compensate for a damaged gate.

- For gate operators utilizing Type D protection:
  1. The gate operator controls must be placed so that the user has full view of the gate area when the gate is moving.
  2. A warning placard shall be placed adjacent to the controls.
  3. An automatic closing device (such as a timer, loop sensor, or similar device) shall not be employed.
  4. No other activation device shall be connected.

- Controls intended for user activation must be located at least six feet (6') away from any moving part of the gate and where the user is prevented from reaching over, under, around or through the gate to operate the controls. Outdoor or easily accessible controls should have a security feature to prevent unauthorized use.

- The Stop and/or Reset button must be located in the line-of-sight of the gate. Activation of the reset control shall not cause the operator to start.

- A minimum of two (2) **WARNING SIGNS** shall be installed, one on each side of the gate where easily visible.

- For gate operators utilizing a non-contact sensor:
  1. See the instructions on the placement of non-contact sensors for each type of application.
  2. Care shall be exercised to reduce the risk of nuisance tripping, such as when a vehicle trips the sensor while the gate is still moving in the opening direction.
  3. One or more non-contact sensors shall be located where the risk of entrapment or obstruction exist, such as the perimeter reachable by a moving gate or barrier.

- For gate operators utilizing contact sensors:
  1. One or more contact sensors shall be located where the risk of entrapment or obstruction exist, such as at the leading edge, trailing edge, and post mounted both inside and outside of a vehicular horizontal slide gate.
  2. One or more contact sensors shall be located at the bottom edge of a vehicular vertical lift gate.
  3. One or more contact sensors shall be located at the pinch point of a vehicular vertical pivot gate.
  4. A hardwired contact sensor shall be located and its wiring arranged so that the communication between the sensor and the gate operator is not subjected to mechanical damage.
  5. A wireless contact sensor such as one that transmits radio frequency (RF) signals to the gate operator for entrapment protection functions shall be located where the transmission of the signals are not obstructed or impeded by building structures, natural landscaping or similar obstructions. A wireless contact sensor shall function under the intended end-use conditions.
  6. One or more contact sensors shall be located at the bottom edge of a vertical barrier (arm).

- Be sure you have instructed the owner of the gate operator about safe and proper operation and testing of the gate operator.
Vehicular gate operator products provide convenience and security. However, gate operators must use high levels of force to move gates and most people underestimate the power of these systems and do not realize the potential hazards associated with an incorrectly designed or installed system. These hazards may include:

- Pinch points
- Entrapment areas
- Reach through hazards
- Absence of entrapment protection devices
- Improperly located access controls
- Absence of vehicle protection devices
- Absence of controlled pedestrian access

In addition to these potential hazards, automated vehicular gate systems must be installed in accordance with the UL 325 Safety Standard and the ASTM F2200 Construction Standard. Most people are unaware of, or are not familiar with, these standards. If an automated vehicular gate system is not properly designed, installed, used and maintained, serious injuries or death can result. Be sure that the installer has instructed you on the proper operation of the gate and gate operator system.

Be sure that the installer has trained you on proper and safe operation of this gate operating system and about the basic functions of the required reversing systems associated with your gate operating system and how to test them (see section 7). These include reversing loops, inherent reversing system, electric edges, photoelectric cells, or other external devices.

- This Owner's Manual is your property. Keep it in a safe place for future reference.
- Be sure that all access control devices are installed a minimum distance of 6 feet away from the gate and gate operator, or in such a way that a person cannot touch the gate or gate operator while using the device. If access control devices are installed in violation of these restrictions, immediately remove the gate operator from service and contact your installing dealer.

Loops and loop detectors, photo-cells or other equivalent devices must be installed to prevent the gate from closing on vehicular traffic.

The speed limit for vehicular traffic through the gate area is 5 MPH. Install speed bumps and signs to keep vehicular traffic from speeding through the gate area. Failure to adhere to posted speed limits can result in damage to the gate, gate operator, and to the vehicle.

Be sure that all persons who will use the gate system are familiar with the proper use of the gate and gate operator and are familiar with the possible hazards associated with the gate system.

Be sure that warning signs are permanently installed on both sides of the gate in an area where they are fully visible to traffic.

It is your responsibility to periodically check all entrapment protection devices. If any of these devices are observed to function improperly, remove the operator from service immediately and contact your installing or servicing dealer.

Follow the recommended maintenance schedule.

Do not allow children to play in the area of the operator or to play with any gate-operating device.

To remove the gate operator from service, operate the gate to the full open position and then shut off power to the operator at the service panel.
**UL 325 Entrapment Protection**

**UL 325 Classifications**

**Class I - Residential Vehicular Gate Operator**
A vehicular gate operator (or system) intended for use in garages or parking areas associated with a residence of one-to four single families.

**Class II - Commercial/General Access Vehicular Gate Operator**
A vehicular gate operator (or system) intended for use in a commercial location or building such as a multi-family housing unit (five or more single family units), hotel, garages, retail store, or other buildings accessible by or servicing the general public.

**Class III - Industrial/Limited Access Vehicular Gate Operator**
A vehicular gate operator (or system) intended for use in an industrial location or building such as a factory or loading dock area or other locations not accessible by or intended to service the general public.

**Class IV - Restricted Access Vehicular Gate Operator**
A vehicular gate operator (or system) intended for use in a guarded industrial location or building such as an airport security area or other restricted access locations not servicing the general public, in which unauthorized access is prevented via supervision by security personnel.

**Gate Operator Category**

* B1 and B2 means of entrapment protection must be MONITORED.

**Vertical Barrier Note:** Barrier gate operators (arm) that is not intended to move toward a rigid object closer than 16 inches (406 mm) are not required to be provided with a means of entrapment protection.
GATE - A moving barrier such as a swinging, sliding, raising, lowering, or the like, barrier, that is a stand-alone passage barrier or is that portion of a wall or fence system that controls entrance and/or egress by persons or vehicles and completes the perimeter of a defined area.

RESIDENTIAL VEHICULAR GATE OPERATOR – CLASS I - A vehicular gate operator (or system) intended for use in a home of one-to four single family dwelling, or garage or parking area associated therewith.

COMMERCIAL / GENERAL ACCESS VEHICULAR GATE OPERATOR - CLASS II - A vehicular gate operator (or system) intended for use in a commercial location or building such as a multi-family housing unit (five or more single family units), hotels, garages, retail store, or other building servicing the general public.

INDUSTRIAL / LIMITED ACCESS VEHICULAR GATE OPERATOR - CLASS III - A vehicular gate operator (or system) intended for use in an industrial location or building such as a factory or loading dock area or other locations not intended to service the general public.

RESTRICTED ACCESS VEHICULAR GATE OPERATOR - CLASS IV - A vehicular gate operator (or system) intended for use in a guarded industrial location or building such as an airport security area or other restricted access locations not servicing the general public, in which unauthorized access is prevented via supervision by security personnel.

VEHICULAR BARRIER (ARM) OPERATOR (OR SYSTEM) - An operator (or system) that controls a cantilever type device (or system), consisting of a mechanical arm or barrier that moves in a vertical arc, intended for vehicular traffic flow at entrances or exits to areas such as parking garages, lots or toll areas.

VEHICULAR HORIZONTAL SLIDE-GATE OPERATOR (OR SYSTEM) - A vehicular gate operator (or system) that controls a gate which slides in a horizontal direction that is intended for use for vehicular entrance and exit to a drive, parking lot, or the like.

VEHICULAR SWING-GATE OPERATOR (OR SYSTEM) - A vehicular gate operator (or system) that controls a gate which moves in an arc in a horizontal plane that is intended for use for vehicular entrance and exit to a drive, parking lot, or the like.

SYSTEM - In the context of these requirements, a system refers to a group of interacting devices intended to perform a common function.

WIRED CONTROL - A control implemented in a form of fixed physical interconnections between the control, the associated devices, and an operator to perform predetermined functions in response to input signals.

WIRELESS CONTROL - A control implemented in means other than fixed physical interconnections (such as radio waves or infrared beams) between the control, the associated devices, and an operator to perform predetermined functions in response to input signals.

INHERENT ENTRAPMENT PROTECTION SYSTEM - A system, examples being a motor current or speed sensing system, which provides protection against entrapment upon sensing an object and is incorporated as a permanent and integral part of the operator.

EXTERNAL ENTRAPMENT PROTECTION DEVICE - A device, examples being an edge sensor, a photoelectric sensor, or similar entrapment protection device, which provides protection against entrapment when activated and is not incorporated as a permanent part of an operator.

ENTRAPMENT - The condition when an object is caught or held in a position that increases the risk of injury.
SECTION 1 - INSTALLATION

Prior to beginning the installation of the swing gate operator, we suggest that you become familiar with the instructions, illustrations, and wiring guidelines in this manual. This will help ensure that your installation is performed in an efficient and professional manner compliant with UL 325 safety and ASTM F2200 construction standards.

The proper installation of the vehicular swing gate operator is an extremely important and integral part of the overall access control system. Check all local building ordinances and building codes prior to installing this operator. Be sure your installation is in compliance with local codes.

1.1 Underground Conduit Requirements

- The conduit requirements are for a typical slide gate operator installation (the secondary operator is shown for those applications where a secondary operator may be used). The conduit requirements for your application may vary from this depending on your specific needs.
- Use only sweeps for conduit bends. Do not use 90° elbows as this will make wire pulls very difficult and can cause damage to wire insulation. DoorKing recommends using 3/4-inch conduit.
- Installation of External Entrapment Protection Devices are REQUIRED (photo sensors and/or reversing edges).
- Be sure that all conduits are installed in accordance with local codes.
- Never run low voltage rated wire insulation in the same conduit as high voltage rated wire insulation.

1.2 Concrete Pad

Operator and Conduit Location

Concrete pad MUST be level. Note: Bevel the edges of concrete pad to eliminate water puddling under the operator.

Underground depth of the concrete pad is determined by soil conditions and local building codes. Reinforced concrete recommended.
1.3 Installation Layouts

48" Gate Attachment Point - Gates up to 18 Ft.

Closed Gate

Arm Calculations

Drive Arm
67.94" / 2 = 33.97 (round number up) = 34 inches

Connecting Arm
67.94" + 17.61" - 33.97" = 51.58 (round number down) = 51.5 inches

Note: Maximum usable connecting arm length is 58.5 inches.

Note: Arm length is measured from center hole to center hole. “Actual” arm length will be longer.

Open Gate

Arms in Open Position

Arms in Closed Position
**46" Gate Attachment Point - Gates up to 18 Ft.**

**Closed Gate**

**Arm Calculations**

**Drive Arm**

\[
\frac{67.88}{2} = 33.94 \text{ (round number up)} = 34 \text{ inches}
\]

**Connecting Arm**

\[
67.88 + 18.38 - 33.94 = 52.32 \text{ (round number down)} = 52.25 \text{ inches}
\]

---

**Note:**

- Maximum usable connecting arm length is 58.5 inches.
- Arm length is measured from center hole to center hole. “Actual” arm length will be longer.

---

**Closed Gate**
36” Gate Attachment Point - Gates up to 14 Ft.

Closed Gate

Arm Calculations

Drive Arm
\[
\frac{50.99”}{2} = 25.495 \text{ (round number up)} = 25.5 \text{ inches}
\]

Connecting Arm
\[
50.99” + 17.56” - 25.495” = 43.055 \text{ (round number down)} = 43 \text{ inches}
\]

Note: Maximum usable connecting arm length is 58.5 inches.

Note: Arm length is measured from center hole to center hole. “Actual” arm length will be longer.

1.4 Overlapping Bi-Parting Gate Operator Positions

When installing overlapping gates (using a maglock to secure gates in the center or architectural overlapping design etc.), certain considerations must be taken into account or gates will NOT operate correctly.

The SECONDARY operator OPENS 1.5 secs BEFORE the primary operator (SW2, switch 5 - ON) to allow the secondary operator’s gate to stay clear of the gate overlap. It is VERY important to install the SECONDARY operator on the gate that opens FIRST according to YOUR specific gate layout or gates will NOT operate correctly.

IMPORTANT
All control, loop detector, safety and auxiliary devices MUST be wired to the PRIMARY operator ONLY.
AC power and the DKS RS-485 communication cable (included) OR 3 bi-parting gate wires are also wired to the primary operator.

IMPORTANT
PRIMARY operator is determined by pressing its KEY SWITCH FIRST after powering up operators.
This establishes Primary/Secondary operator order.

IMPORTANT
The distance EACH gate travels while cycling MUST be set the same (Limit switch settings), otherwise the 1.5 second time delay may NOT allow the primary operator’s gate with the overlap to CLOSE BEFORE the secondary operator’s gate.

IMPORTANT
Only AC power and the DKS RS-485 communication cable (included) OR 3 bi-parting gate wires are wired to the SECONDARY operator.
1.5 Securing Operator to Pad
Permanently attach the operator to the concrete pad using six (6) 3/8” x 3” sleeve anchors (not supplied).

**Sleeve Anchor (Not supplied)**

**IMPORTANT:** Center mounted sleeve anchors are **REQUIRED** to prevent chassis from flexing during operation.

1.6 Attach Gate Bracket

1. Release hub with release tool. **DO NOT REMOVE HUB!**
2. Bolt crank arm to operator.
3. Slide elbow assembly on crank arm.
4. Bolt control arm to gate bracket.
5. Slide control arm into elbow assembly. **KEEP ARM ASSEMBLY LEVEL.**
6. Bolt gate bracket to gate.

**CAUTION**

**DO NOT REMOVE HUB!**

Arm assembly and gate bracket **MUST** be level for gate to function correctly.

**31”**
1.7 Determining Arm Lengths

Slide elbow assembly back and fourth, manually opening and closing gate until satisfied with the gate’s 90° open and fully closed positions.

Mark and cut off excess arms. Secure arms to elbow assembly with 6 allen screws. Tighten hub and replace release tool. Install safety covers.

1.8 Installation of Warning Signs

This DoorKing Swing Gate Operator is shipped with two warning signs. The purpose of the warning sign is to alert uninformed persons, and to remind persons familiar with the gate system, that a possible hazard exists so that appropriate action can be taken to avoid the hazard or to reduce exposure to the hazard. See page 3 for suggested mounting positions of signs.

- Permanently install the supplied warning signs in locations so that the signs are visible by persons on both sides of the gate.
- Use appropriate hardware such as wood or sheet metal screws (not supplied) to install the warning signs.
1.9 Entrapment Protection Installation

External Entrapment Protection Devices:
In addition to the inherent reversing sensor system, this operator has a UL 325 terminal for the connection of photo sensors-Type B1 and/or reversing edges-Type B2 entrapment protection required by UL 325 standards. Entrapment Protection must be provided for the gate system where the risk of entrapment or obstruction exists. The operator will not run without one or more monitored type B1 or B2 entrapment protection devices. Install these devices where the risk of entrapment or a safety hazard exists while the gate is moving. Specific installations will vary.

Typical UL Photo Sensor mounting height and distance away from gate.

CLOSE Beam: Obstructed close-direction photo beam will REVERSE the gate during the close-direction only. Gate will close when the obstructed photo beam has been cleared.

OPEN Beam: Obstructed open-direction photo beam will STOP the gate during the open-direction only. Gate will resume the open cycle when the obstructed photo beam has been cleared.

Entrapment Protection must be provided for the gate system where the risk of entrapment or obstruction exists. The operator will not run without one or more monitored type B1 or B2 entrapment protection devices.

See page 27 for UL 325 terminal wiring for a monitored photo sensor.

CLOSE Beam: Obstructed close-direction photo beam will REVERSE the gate during the close-direction only. Gate will close when the obstructed photo beam has been cleared and the close-timer times out.

OPEN Beam: Obstructed open-direction photo beam will STOP the gate during the open-direction only. Gate will resume the open cycle when the obstructed photo beam has been cleared.

See page 27 for UL 325 terminal wiring for a monitored photo sensor.
CLOSING Reversing Edge: Obstructed close-direction reversing edge will Reverse the gate back to the open position. Another input is needed to close the gate.

ENTRAPMENT PROTECTION

Closing Gate

OPENING Reversing Edge: Obstructed open-direction reversing edge will Reverse the gate 2 inches and STOP. Another input is needed to open the gate.

ENTRAPMENT PROTECTION must be provided for the gate system where the risk of entrapment or obstruction exists. The operator will not run without one or more monitored type B1 or B2 entrapment protection devices.

See page 27 for UL 325 terminal wiring for a reversing edge.

CLOSING Reversing Edge: Obstructed close-direction reversing edge will Reverse the gate back to the open position. Another input is needed to close the gate.

ENTRAPMENT PROTECTION

Opening Gate

ENTRAPMENT PROTECTION must be provided for the gate system where the risk of entrapment or obstruction exists. The operator will not run without one or more monitored type B1 or B2 entrapment protection devices.

See page 27 for UL 325 terminal wiring for a reversing edge.

Typical Reversing Edge mounted on end of gate.

If the bottom of gate is greater than 6" but less than 16" above the ground at any point in its arc of travel, it is recommended mounting a reversing edge for safety.

Typical Reversing Edge mounted on bottom of gate when necessary.
SECTION 2 - AC INPUT POWER TO OPERATOR(S)

Before attempting to connect any wiring to the operator, be sure that the circuit breaker in the electrical panel is in the OFF position. Permanent wiring must be installed to the operator as required by local electrical codes. It is recommended that a licensed electrical contractor perform this work.

Since building codes vary from city to city, we highly recommend that you check with your local building department prior to installing any permanent wiring to be sure that all wiring to the operator (both high and low voltage) complies with local code requirements.

THIS GATE OPERATOR MUST BE PROPERLY GROUNDED!!

2.1 AC Power Wire Runs and Terminal Connection

If power wiring is greater than the maximum distance shown, it is recommended that a service feeder be installed. When large gauge wire is used, a separate junction box must be installed for the operator connection. The wire table is based on stranded copper wire. Wire run calculations are based on an AC power source with a 3% voltage drop on the power line, plus an additional 10% reduction in distance to allow for other losses in the system.

This table illustrates the high voltage AC power wire size and distance limitations.

<table>
<thead>
<tr>

<td>1450</td>
<td>2100</td>
</tr>
<tr>
<td>0.9</td>
<td>2000</td>
<td>3500</td>
<td>5900</td>
<td>8900</td>
</tr>
</tbody>
</table>

“Optional” Heater Installation Note: When installing a heater, refer to the “high voltage AC power wire size and distance limitations” table on the instruction sheet with the heater kit for AC power wire run limitations.

**DO NOT** power up the operator until “Section 2.2” is complete (see next page).

**DO NOT** wire solar power when using AC power.

115 VAC Connection

- **DANGER** HIGH VOLTAGE!

230 VAC Connection

- **CAUTION** High Voltage AC input power MUST MATCH the operator selector switch or DAMAGE will occur and VOID the warranty!

An EXTERNAL ENTRAPMENT PROTECTION DEVICE MUST be connected or the gate operator WILL NOT function.
**2.2 Setting Input Power Jumper and Turning Power ON**

The “POWER SEL” jumper on the circuit board **MUST** be set correctly or the operator will not function correctly.

**DO NOT** cycle the operator until the “DIP-Switches” and the “Limit Switches” have been adjusted. Damage could occur to the gate and gate operator. See pages 21-23.

**Important:** Pins 1 and 2 MUST be jumpered together when using AC input power.

**DO NOT** jumper pins 2 and 3 together or circuit board will shut off power after 5 minutes of idle time.

**Important Battery Plug Note:**

Battery Plug P2 comes from the factory unplugged and needs to be plugged into circuit board when operator is ready to be powered up.

**Using DC Power ONLY Note:**

If powering up operator using ONLY DC power, the Key Switch must be pressed AFTER DC power switch is turned ON to power up operator.

**2.3 Input Power for Dual Gate Operators**

- Each operator **MUST** be supplied with it’s own input power wire.
- All control, loop detector, safety and auxiliary devices **MUST** be wired to the primary operator. See pages 26, 27 and 28 for wiring information.
- Primary operator is determined by pressing its Key Switch FIRST after powering up operators. This establishes Primary/Secondary operator order.
SECTION 3 - ADJUSTMENTS

The switch settings and adjustments in this chapter should be made after your installation and wiring to the operator(s) is complete. Whenever any of the programming DIP-switches on the circuit board are changed, ALL power must be shut-off, and then turned back on OR press reset button on circuit board for the new setting to take effect.

3.1 4100 Circuit Board Descriptions and Adjustments

How LEDs Function
Illuminated LEDs indicates that low voltage power is being applied to the circuit board.

Input LEDs should be OFF and will only illuminate when the input that is next to the LED is activated. See page 25. Limit LEDs will only illuminate when the respective limit switch has been activated. Loop LEDs will only illuminate when a reverse or exit loop is activated (Vehicle passing over a loop).

Self-Test
Self-test mode is for bench checks ONLY! Operator MUST be disconnected from the gate. The operator will continually cycle the gate. The jumper must be set at normal mode for normal operator function.

Limit/Alarm Plug P3 Terminal

10-Pin UL 325 / 3 Button Station Removable Terminal
See pages 26 and 27.

3 Button Station Jumper
See page 26.

All Power Switches
Note: Alarm reset button WILL NOT reset circuit board after changing DIP-switch settings. See page 29.

Reverse Sensor
Adjust reversing sensitivity for the open AND close direction of the operator. See page 24.

Auto-Close Timer
Auto-close timer (when turned on) SW 1, switch 2.

Time Delay:
Adjust from 1 second (full clockwise) to approximately 23 seconds (full clockwise).

Key Switch: Cycles the operator when pressed. Will use Auto-Close timer when turned ON.
Note: If powering up operator using ONLY DC power, the key switch MUST be pressed AFTER DC power switch is turned ON to power up operator.

Bi-Parting Gates Note: MUST be pressed on PRIMARY operator FIRST after powering up operators to establish PRIMARY/Secondary operator order.

DIP-Switches
Set the DIP-switches on the circuit board to the desired setting. See switch-settings on next 2 pages.

Reset Button: Press after changing a DIP-switch setting on the board or if board locks up during operation.

Board Relay
Dry relay contacts (terminals 13-14) can be set for Normally Open (NO) or Normally Closed (NC) operation by placing the relay shorting bar on the N.O. or N.C. pins respectively. SW 1, switches 6 and 7 must be set to control relay. See next page for descriptions.
# 3.2 DIP-Switch Settings for 4100 Circuit Board

The two DIP-switches located on the circuit board are used to program the operator to operate in various modes and to turn on or off various operating features. Whenever a switch setting is changed, reset button on circuit board must be pressed for the new setting to take affect.

3.2 Continued

**SW-1 Switch**
(Top 8 switches on circuit board)

Typical Settings
- Opening - RT/LT
- Normal - ON
- Normal - ON
- MUST use - OFF
- Normal - OFF
- Normal - OFF
- Normal - OFF
- Normal - OFF

**Switch 1 - Operator Opening Direction:** Must OPEN the operator’s gate upon initial AC power up and open command. If the first open command begins to close the gate, turn AC power off and reverse this switch.

**Switch 2 - Auto-Close Timer:** Turns the auto-close timer on or off. If auto-close is ON, maximum time that can be set for is approximately 23 secs. If auto-close is OFF, an open gate will not close until a manual input is received.

**Switch 3 - EXIT Loop Port Output / Full Open Input:** Determines that a device wired to main terminal 4 is a normal full open command (ON) OR terminal 4 becomes the output from the exit loop detector that is plugged into the EXIT Loop port in the circuit board (OFF) (Used for specialized functions).

**Switch 4 - Standard Reverse:** This switch MUST be turned OFF for the Model 6524. An input to main terminal 10 (Photo Sensor) AND/OR Reverse Loops will reverse a CLOSING gate back to open position. If auto-timer is turned ON, timer will time out and close the open gate. Note: SW 2, switch 4 MUST also be turned OFF when an external entrapment device (Photo Sensor) has been wired to main terminal 10 (see below).

DO NOT turn this switch ON.

**Switch 5 - Quick-Close Timer Override:** This switch MUST be turned OFF for the Model 6524. DO NOT turn ON.

**Switches 6-7 - Relay:** These work in conjunction with each other and determine when the relay on the board (main terminals 13-14) will be activated. This relay can be used as a switch for various functions such as illuminating a warning light when the gate is moving, or turning on a green light when the gate is full open.

**Switch 8 - Accessory Power / Maglock Power:** A maximum of 500 mA of constant power is supplied to any accessory connected to main terminals 11 and 12 when this switch is OFF.

Turn this switch ON ONLY if a magnetic lock is connected to main terminals 11 and 12. This applies magnetic lock power and logic to these terminals which is a Normally Closed function: Power is shut off .5 sec. prior to gate starting and remains off while gate is opening and in the open position. Power is turned on after gate is closed again.

**SW-2 Switch**
(Bottom 8 switches on circuit board)

Typical Settings
- MUST use - OFF
- MUST use - ON
- Normal - OFF
- Shadow Loop - ON
- Normal - OFF
- MUST use - OFF
- MUST use - OFF
- MUST use - OFF

**Switches 1-2 - Select Operator Type:** Sets the type operator that will be used with the circuit board.

**Switch 3 - Input Power Failure Mode:** When this switch is turned OFF and a AC input power failure occurs, gate will continue to operate normally using ONLY battery back-up power. When battery back-up power has been depleted, gate will remain CLOSED and operator will shut down. After AC input power has been restored, gate will return to normal operation.

When this switch is turned ON, gate will automatically fully open and operator will shut down during an AC input power failure. After AC input power has been restored, gate will close.

**Switch 4 - Reverse/Shadow:** When this switch is turned OFF, external entrapment device (Photo Sensor) wired to main terminal 10 is a standard reverse input (see SW 1, switch 4 above).

This switch MUST be turned ON when using a shadow loop, see page 28 for more information about shadow loop connection.

**Switch 5 - Overlapping Dual Gates:** When the gate overlap is OFF, the gate operator(s) will start the open and close cycles at the same time. This is the normal setting for a single gate operator. Turning the gate overlap ON when using dual gate operators will cause the secondary operator to start the open cycle 1.5 seconds before the primary operator. The primary operator will start the close cycle 1.5 seconds before the secondary operator.

**Switch 6 - Circuit Board Power Management:** Turn OFF when using 115/230V input power to allow circuit board to have constant power. DO NOT turn ON.

Note: ONLY turn this switch ON when using solar power. It minimizes the power drain by the circuit board. When the gate has been closed for 5 min. or held open for 5 min., circuit board will power down. Main terminals 1, 2, 3 and loop detector ports will remain powered up. An input from one of these connections will power up the circuit board again. NOT used for AC input power.

**Switches 7-8 - Not Used:** These switches MUST be turned OFF for the Model 6524. DO NOT turn ON.
3.3 Limit Sensors

The hub must not slip during operation. Tighten nut to stop any slipping.

Important Limit Sensor Adjustment Note:
It is very important NOT to cycle the gate operator before the limit sensors are in the correct position or it could cause damage to the gate and operator.

With power ON, Manually release the gate operator hub with the release tool (See page 32). Physically move the gate to the desired open position. Loosen the set screw on the OPEN limit sensor and slowly slide it under the magnetic sensor activator until the OPEN limit Sensor LED lights up on the circuit board. Tighten the set screw and repeat this process for the close gate position. Secure the hub with the release tool and cycle the operator a few times and readjust if necessary.

Note: If P3 plug is not connected to the circuit board and power is turned on, alarm will sound and operator will NOT function.

Note: If P3 plug is not connected to the circuit board and power is turned on, alarm will sound and operator will NOT function.
3.4 Inherent Reverse Sensor Adjustment

This vehicular gate operator is equipped with an inherent adjustable reversing sensor (Type A) used as entrapment protection according to UL 325 standards. The gate will reverse direction after “physically” encountering an obstruction in either the opening or closing gate cycle.

If the Auto-Close Timer (DIP-switch SW 1, switch 2) is ON and the gate “physically” encounters an obstruction during the CLOSING cycle, it will reverse to the open position and HOLD the gate at this position (Soft shutdown condition). Another input command is needed before the gate will reset and close again (open device command, safety device command, exit loop input).

For the reverse sensors to function correctly, THE HUB MUST NOT SLIP when the gate encounters an obstruction. The gate must be properly installed and work freely in both directions. A good set of roller bearing hinges is essential for proper swing gate operation.

For the reverse system to function correctly, the gate must be properly installed and work freely in both directions and the limit sensors must be properly adjusted BEFORE adjusting the reverse sensors. The ideal adjustment will allow the operator to move the gate through its entire travel cycle without reversing, but will reverse upon contact with an obstruction with no more than 40 Lbs of force. This force can be measured with a gate scale.

**CAUTION:** Keep pedestrians and vehicles clear of the gate while adjusting and testing sensors!

Note: “Push to Operate” button will use the Auto-Close timer if turned ON (SW 1, switch 2 ON).

1. Press the “Push to Operate” button to OPEN the gate.

2. While gate is opening, slowly rotate the reverse sensor clockwise until the LED lights up and the gate reverses direction. Rotate the reverse sensor back counter-clockwise approximately 1/8 turn to decrease the sensitivity (LED will turn off).
   
   **Note:** The LED will light up during the first seconds of gate travel. Wait until it turns off before adjusting the reverse sensor.

3. Press the “Push to Operate” button and CLOSE the gate. Make sure the gate closes completely. If it reverses and opens (LED will turn on), rotate the reverse sensor counter-clockwise a little more to decrease the reverse sensitivity (LED will turn off).
   
   Cycle the gate a few times to be sure that it cycles completely in both directions, adjusting the sensor as necessary.

**Dual Operators:**

Each gate operator’s reverse sensor will have to be adjusted when dual operators have been installed.

**Test the operator reversing sensitivity:**

Place an immobile object along the gate path, allowing the gate to strike it while in the open and close cycles. The gate must reverse direction after striking the object. If it does not, increase the reverse sensitivity and repeat this testing until the correct sensitivity has been achieved in BOTH directions. The operator will assume a soft shutdown (Hold the auto-close timer) after striking and reversing the gate which will require pressing the “Push to Operate” button to cycle the operator again.
### SECTION 4 - WIRING TERMINALS

#### 4.1 Terminal Descriptions

**3 Button Station**
- Use a standard 4-wire 3-button control station. DoorKing’s 3-wire 3-button control station cannot be used.
- When using a 3-button control station, the 3-pin jumper MUST be set to ON.
- See next page for wiring.

**Main Terminal #3 Note:**
Exceeding 250 mA of power from this terminal may cause the circuit board transformer to overheat, causing intermittent problems.

**Low Voltage Common**
1. Full Open
2. 24 VDC - 250 mA max. (See note above)
3. Full Open / Loop out
4. Low Voltage Common
5. Full Open
6. Low Voltage Common
7. Do Not Use
8. Low Voltage Common
9. Reverse / Shadow
10. Low Voltage Common
11. 24 VDC Accessories / Maglock
12. Relay
13. Relay
14. Low Voltage Common
15. Bi-Parting
16. Bi-Parting
17. Common
18. Tracker Data
19. Tracker In
20. SW 1

**Operation of relay is dependent on setting of SW 1, switches 6 and 7.**
- Relay contacts can be set for Normally Open (NO) or Normally Closed (NC) operation.
- Contact rating is 1 amp maximum at 24-volts DC.

**Bi-Parting Gates ONLY.** Connect the secondary gate operator terminals 16-17-18 to this primary terminal 16-17-18 respectively.

**Important! Secondary operator terminals overlap with primary terminals. See page 12.**

**Tracker Data**
- 24 VDC - 250 mA max.
- The LED will light when that terminal input gets activated.

**UL 325**
See page 27

**3 Button Station Note:**
- Data will be reported about this gate operator’s SPECIFIC activity to a DoorKing access control system. A list of the events will be “Tracked” and stored in the access control system.

**SW 1, SW 2, SW 3, SW 4**
- SW 8 OFF: 24-volts DC, 500 mA constant power can be provided for desired accessories wired to terminal 12 when the maglock is NOT used.
- SW 8 ON: 24-VDC Maglock power is provided except when the gate is opening or open (Normally Closed function). 1 Amp Max.

**Main Terminal Input LEDs Note:**
- The LED that is beside the main terminal wiring input will light when that terminal input gets activated.

**Main Terminal Input #10 Note:**
- This input ONLY functions when gate is fully opened or in the closing cycle.
- SW 1, switch 3 is ON, functions as a normal full open input (Normal setting).
- SW 1, switch 3 is OFF, input to terminal #4 becomes the output from the EXIT loop detector plugged into the EXIT loop port. (Used for specialized functions).

**Primary operator is determined by pressing its KEY SWITCH FIRST after powering up operators. This establishes Primary/Secondary operator order.**
### 4.2 Control Wiring

#### UL 325/3 Button 10-Pin Terminal

**3-Button Control Station**

Use a standard 4-wire 3-button control station. DoorKing’s 3-wire 3-button control station cannot be used.

**Important:** Controls intended for user activation must be located at least six (6) feet away from any moving part of the gate and where the user is prevented from reaching over, under, around or through the gate to operate the controls. Emergency access controls can only be accessible by authorized personnel (e.g., fire, police, EMS) and in the line-of-sight of the gate. The system can keep track of gate operator cycle count, shorted inputs, loop detector problems, any forced entry attempts, if the gate has struck anything during the open or close cycle, power interruptions, etc. For more detailed information refer to the Tracker Expansion Board Hardwired Installation/Owner’s Manual, DoorKing P/N 235-065.

**Main Terminal #3 Note:** Exceeding 250 mA of power from this terminal may cause the circuit board transformer to overheat, causing intermittent problems.

**Standard “Reverse” Closing-Direction Photo Sensors**

- **SW 1:** switch 4 **MUST** be OFF.
- **SW 2:** switch 4 **MUST** be OFF.

**Gate Tracker** - DoorKing Access Control Systems (Models 1833, 1835, 1837 or 1838) tracker system can be connected. This system can keep track of gate operator cycle count, shorted inputs, loop detector problems, any forced entry attempts, if the gate has struck anything during the open or close cycle, power interruptions, etc. For more detailed information refer to the Tracker Expansion Board Hardwired Installation/Owner’s Manual, DoorKing P/N 235-065.

**3-Wire Radio Receiver**

- **Com 1:** 4-Wire Relay Receiver
- **Com 2:** 3-Wire Radio Receiver
- **Com 3:** Quad Box
- **Com 4:** 3-Pin With Jumper
- **Com 5:** Open N.O.
- **Com 6:** Close N.O.
- **Com 7:** Stop N.C.
- **Com 8:** Com
- **Com 9:** #7 N.O.
- **Com 10:** #10 N.O.

**Safety Opening Device**

- **Not:** All stand-alone and telephone entry devices must use a separate power source.
- **Note:** Not stand-alone key switch
- **Stand-Alone Keypad**
- **Stand-Alone Card Reader**
- **Maglock**

**Primary Operator**

- **Bi-Parting Gates**
- **Tracker Data**
- **Tracker In**

**Secondary Operator**

- **Bi-Parting Gates**
- **Tracker Data**
- **Tracker In**

**3-Pin Remote Terminal**

- **Power:** limited to 250 mA

**Power is limited to 250 mA**

**Remote Terminal**

- **Com 1:** 4-Wire Relay Receiver
- **Com 2:** 3-Wire Radio Receiver
- **Com 3:** Quad Box
- **Com 4:** 3-Pin With Jumper
- **Com 5:** Open N.O.
- **Com 6:** Close N.O.
- **Com 7:** Stop N.C.
- **Com 8:** Com
- **Com 9:** #7 N.O.
- **Com 10:** #10 N.O.

**Stand-Alone Card Reader**

- **SW 1:** 3-Pin With Jumper
- **SW 2:** 3-Pin With Jumper

**Maglock**

- **SW 1:** 3-Pin With Jumper
- **SW 2:** 3-Pin With Jumper

**Important:** Controls intended for user activation must be located at least six (6) feet away from any moving part of the gate and where the user is prevented from reaching over, under, around or through the gate to operate the controls. Emergency access controls can only be accessible by authorized personnel (e.g., fire, police, EMS) and in the line-of-sight of the gate. The system can keep track of gate operator cycle count, shorted inputs, loop detector problems, any forced entry attempts, if the gate has struck anything during the open or close cycle, power interruptions, etc. For more detailed information refer to the Tracker Expansion Board Hardwired Installation/Owner’s Manual, DoorKing P/N 235-065.

**Primary operator is determined by pressing its button after powering up operators. This establishes Primary/Secondary operator order.**
4.3 Entrapment Protection Wiring

**UL 325 Terminal**
External Entrapment Protection Device Connection

**Main Terminal**
- OPEN Beam Stop (Switch 1)
- CLOSE Beam Reverse (Switch 2)
- OPEN Edge/Beam Reverse (Switch 3)
- CLOSE Edge/Beam Reverse (Switch 4)

**Photo Sensors POWER:**
Terminal 12 supplies 24 VDC, 500 mA of constant power for desired accessories.

**IMPORTANT:** Photo sensors must use Normally Closed (NC) contacts with the beam set for light operate (relay activated when beam is not obstructed). Some manufacturer’s photo sensor contacts are labeled as Normally Open (NO) but their relay functions the same way as described above. See specific manufacturer’s wiring manual for more information about their specific relay function.

**Entrapment Protection must be provided for the gate system where the risk of entrapment or obstruction exists. The operator will not run without one or more monitored type B1 or B2 entrapment protection devices.**

**UL 325 Terminal**
- ONLY connect monitored devices.
- Exceeding 250 mA of power from this terminal may cause the circuit board transformer to overheat, causing intermittent problems.

**Monitored Device Note:** Only 1 monitored Device can be connected to each input. An OPTIONAL Expansion Board (sold separately) will allow connection for additional devices.

**To #3 Power**
- To Common
- To Edge/Beam Input
- To Common

**To #3 Power**
- To Common
- To Edge/Beam Input
- To Common

**To UL 325 Terminal**
- 24VDC 500 mA MAX
- to UL 325 Terminal
- SW1, switch 8 MUST be OFF

**OPTIONAL Wireless Note:**
Refer to the instruction sheet that comes with the receiver/transmitter for more specific wiring and mounting instructions.

**Edge/Beam Inputs Note:**
- (3) Open and (4) Close inputs will activate in EITHER direction of gate travel.
- When using dual operators: a edge/beam can be connected from the primary gate to #3 and the secondary gate’s edge/beam can be connected to #4.
4.4 Loop Detector Wiring

To help protect the operator from accidentally closing on vehicles in the gate’s path, DoorKing highly recommends that loops and loop detectors be installed. Loops are laid underneath, cut into asphalt or concrete driveways or buried beneath gravel and earth driveways. A loop detection system will sense a vehicle like a metal detector and send a signal to the gate operator preventing the gate from automatically opening or closing on a vehicle when it is in the gate’s path. DoorKing recommends that a licensed installer perform this work.

- Loop detector wiring is shown for DoorKing plug-in loop detectors. If other loop detectors are used, refer to the installation instructions supplied with those detectors for wiring instructions.
- If other detectors are used, use a separate power supply to power these detectors.
- Loop layout shown is for a typical swing gate application with two-way traffic, or one-way exit only traffic.

DoorKing offers a free “Loop and Loop-Detectors Information Manual” PDF located at DoorKing’s web site for more information. www.doorking.com

Automatic Exit Loop

Automatically opens the gate for exiting vehicles without having to use a transmitter or keypad. The exit loop can be placed a minimum of 4 feet away from the reverse loop or far enough away from the gate so the gate has started opening or even completely opened by the time you drive up to it (Free exit).

Shadow Loop

Will ONLY HOLD the main gates in the Full Open Position when a vehicle is on the shadow loop. However, it WILL NOT stop or reverse the main gates once they start to close.

Reverse Loops

Are placed on each side of the gate to prevent the gate from closing on a vehicle in the gate’s path. They will stop or reverse the cycling of the gate while a vehicle is in or near the gate’s pathway.

Loop detector wiring is shown for DoorKing plug-in loop detectors. If other loop detectors are used, refer to the installation instructions supplied with those detectors for wiring instructions.

If other detectors are used, use a separate power supply to power these detectors.

Loop layout shown is for a typical swing gate application with two-way traffic, or one-way exit only traffic.

DoorKing offers a free “Loop and Loop-Detectors Information Manual” PDF located at DoorKing’s web site for more information. www.doorking.com
SECTION 5 - OPERATING INSTRUCTIONS

IMPORTANT SAFETY INSTRUCTIONS

WARNING - To reduce the risk of injury or death:

1. READ AND FOLLOW ALL INSTRUCTIONS.
2. Never let children operate or play with gate controls. Keep the remote control away from children.
3. Always keep people and objects away from gate. NO ONE SHOULD CROSS THE PATH OF THE MOVING GATE.
4. Test the operator monthly. The gate MUST reverse on contact with a rigid object or stop or reverse when an object activates the non-contact sensors. After adjusting the force or the limit of travel, retest the gate operator. Failure to adjust and retest the gate operator properly can increase the risk of injury or death.
5. Use the emergency release only when the gate is not moving and power has been shut-off.
6. KEEP GATES PROPERLY MAINTAINED. Read the owner’s manual. Have a qualified service person make repairs to gate hardware.
7. The entrance is for vehicles only. Pedestrians must use separate entrance.
8. SAVE THESE INSTRUCTIONS.

5.1 Power Switches and Alarm Reset Button

Unlock the power switch cover and open to access the AC POWER, DC POWER and the operator ALARM RESET button.

- **Alarm Siren**
- **AC Power Switch** - Powers the operator ON (toggle up) or OFF (toggle down).
- **DC Power Switch** - Turns the DC system power ON (toggle up) or OFF (toggle down).
- **Alarm Reset Button** - Only used to turn off the entrapment alarm and to restart the operator AFTER a HARD shutdown has occurred.

**Note:** If powering up operator using ONLY DC power, the key switch MUST be pressed (located on circuit board) AFTER DC power switch is turned ON to power up operator.
5.2 Shutdown Conditions

Under various entrapment conditions the operator will assume either a soft or hard (alarm) shutdown. To determine what type of reset action is required, you will need to understand how the different entrapment conditions affect the gate operator.

**Soft Shutdown**

This occurs in various situations where the inherent or external entrapment protection devices have been activated. In a soft shutdown condition, the operator **will not** respond to any input that was present when the entrapment protection device sensed an obstruction. If the gate stops at the open position, the operator will not respond to the automatic close timer.

- **Example 1** - A time clock keys the gate open in the morning and an entrapment protection device senses an obstruction prior to the gate reaching the full open position. If the entrapment is sensed by the inherent system, the gate will reverse and run back to the closed position. The time clock input is still present, but the gate will not re-open.

  NOTE: In some systems, the time clock input comes from the telephone entry system relay. This same relay may also provide open commands for a card reader, MicroPLUS transmitters and the visitor telephone entry. If so, these devices will also be disabled in a soft shutdown condition.

- **Example 2** - If the gate is closing and an entrapment protection device is activated, the gate will either stop or reverse and run back to the open position, depending upon if the external or inherent device was activated. The automatic close timer will not close the gate.

- **Example 3** - Vehicle arrives at open loop and gate runs towards the open position. The inherent entrapment protection is activated. The gate reverses and runs back to the closed position. If the vehicle is still present at the open loop a soft shutdown condition does not occur. The loop input provides an immediate reset of the operator and the gate will again run to the open position.

**Resetting a Soft Shutdown**

In some conditions, a soft shutdown will reset as soon as the entrapment condition clears. For example, if a non-contact sensor (photo sensor) is sensing an obstruction, the operator will stop the gate and assume a soft shutdown condition. When the photocell clears, the operator will return to normal operation.

When the operator is in a soft shutdown, activation of any “intended input” will reset the operator. An “intended input” includes any command input, any standard safety input and any loop input. Activating any of these inputs will reset the gate. At that point the gate will return to normal operation. If the gate is open, the automatic close timer will then time out and close the gate.

**Hard Shutdown (Alarm Activated)**

A hard shutdown condition occurs when the inherent entrapment protection system has sensed **TWO** consecutive obstructions before the gate reaches the full open or closed position.

- **Example** - The gate is closing and the inherent entrapment protection system senses an obstruction and causes the gate to reverse direction. As the gate begins to run in the open direction, a second obstruction is sensed prior to the gate reaching the full open position. Once the second obstruction has been sensed, the operator will stop, the audio alarm will be activated and all standard inputs are shut down (including open commands, safety commands, loop inputs, etc.).

  The audio alarm will sound for five minutes, or until the operator’s alarm reset button is pushed. After (5) five minutes the alarm will “chirp every 5 sec.” and the hard shutdown condition will remain in effect until the alarm reset button is pushed.

- After 5 minutes, the audio alarm will “chirp” every 5 seconds. This indicates that the operator is in a hard shutdown condition and the alarm reset button must be activated to reset the operator and silence the alarm.

  Continued on the next page
5.3 Manual Gate Operation

This operator is equipped with a manual release system that will allow the gate to be pushed open in the event of a power outage or equipment failure. NEVER remove the hub from the operator after manually releasing it.

This gate operator CAN NOT be manually forced open in the event of a power failure without FIRST manually releasing the gate! (See next page)

Never attempt to manually push open any gate with an operator attached to it until you have verified that ALL power to the operator has been shut-off.

Emergency Vehicle Access Conditions

The automatic vehicular gate system must be designed to allow access to emergency vehicles under different operating conditions.

1. During normal powered operation, emergency vehicles access the gate by use of the Emergency Vehicle Access Device installed on your gate system. The type of device that is used in your community is dependent on your city codes. These devices may include (but are not limited to) Fire Department lock boxes, Click-2-Enter radio receivers, strobe light sensors, siren sensors, etc.

2. In the event of a power failure, The gate operator is equipped with a built-in Battery Back-Up System, this system will allow the gate operator to continue to function normally when primary (AC) power is removed.

3. In the event of a primary (AC) power failure and a back-up system (DC) power failure (low charged or dead batteries for example), the system must have a release system to allow the gate to be Manually Operated (See next page).

Resetting a Hard Shutdown

When the operator is in a hard shutdown condition (audio alarm activated or audio alarm “chirps” every 5 seconds), to silence the alarm, press the alarm reset button.

- Before resetting a hard shutdown, determine why the shutdown occurred. Inspect the gate for any obstructions along its path that could have activated the inherent entrapment sensing system. Inspect the gate and gate hardware.

NOTE: DoorKing operators have a built-in alarm reset push button mounted on the operator above the power ON-OFF switch. Activating this button will return the gate operator to normal operation, but will not activate the gate operator.

Once the gate has been reset, an open or close command is needed to start the gate operator. Most activating commands will cause the gate operator to cycle to the open position. This includes activation of a key switch or open command and activation of the automatic exit loop. Activation of a close command will run the gate to the closed position.
Manual Release

A Unlock the cover and rotate sliding door.

Never attempt to manually push open any gate with an operator attached to it until you have verified that ALL power to the operator has been shut-off.

B Remove release tool and place where shown.

C Release hub. Gate can now be manually operated.

CAUTION
DO NOT REMOVE HUB!
### 6.1 Maintenance

When servicing the gate operator, always check any external reversing devices (loops, photocells, etc.) for proper operation. If external reversing devices cannot be made operable, do not place this operator in service until the malfunction can be identified and corrected.

Always check the entrapment protection devices (external and internal) when performing any maintenance. If any of these devices cannot be made operable, remove this operator from service until the cause of the malfunction is identified and corrected. Keeping this operator in service when any entrapment protection devices are malfunctioning creates a hazard for persons which can result in serious injury or death should they become entrapped in the gate.

When servicing this gate operator, always turn power OFF!!

If gearbox requires oil, use only Mobil SYNTHETIC SHC-629 Oil. Do not completely fill gearbox with oil. Gearbox should be half full only. Do not exceed this level.

6.2 Troubleshooting

Have a good VOM meter with Min/Max test button to check voltages and continuity. A Meg-Ohm meter capable of checking up to 500 meg-ohms of resistance is necessary to properly check the integrity of the ground loops. When a malfunction occurs, isolate the problem to one of three areas: 1) the operator, 2) the loop system, 3) the keying devices. Use caution when checking high voltage areas.

1. Check the input indicator LEDs. They should only come ON when a keying device (card reader, push button, etc.) is activated. If any of the input LEDs are ON continuously, this will cause the gate operator to hold open. Disconnect the keying devices one at a time until the LED goes OFF.

2. Check any external entrapment protection devices. Any short or malfunction in these devices can cause the gate operator to stop or to hold open.

3. A malfunction in a loop or loop detector can cause the gate operator to hold open, or to not detect a vehicle when it is present over the loop. The LEDs next to the loop detector ports on the operator circuit board will light only when the loop has detected an object above it. If the LEDs stays on after the object has gone, then the loop detector has malfunctioned. Pull the loop detector circuit boards from the loop ports on the operator circuit board. If the malfunction persists, the problem is not with the loop system. For more information on troubleshooting loops and loop detectors, refer to your loop detector instruction sheet and to the DoorKing Loop and Loop Detector Information Manual.

4. Check to be sure that there are no shorted or open control wires from the keying devices to the gate operator. If a keying device fails to open the gate, momentarily jumper across terminals 1 and 2 (or 1 and 6) on the gate operator circuit board. If the gate operator starts, this indicates that a problem exist with the keying device and is not with the gate operator.

5. Check the high voltage supply. A voltage drop on the supply line (usually caused by using too small supply voltage wires) will cause the operator to malfunction. Refer to the wire size chart in section 2.1 page 18.

<table>
<thead>
<tr>
<th>Symptom</th>
<th>Possible Solution(s)</th>
</tr>
</thead>
</table>
| Operator will not run. Power LED is OFF. | • Check that power to the operator is turned ON.  
• Check for AC power (115/230) at the power input terminals. If power is absent, check incoming power to operator.  
• Be sure AC power switch is ON. Check for 24 VDC at P2, terminals 1 (+) and 2 (-). If no power, faulty bridge rectifier or toroidal transformer. If power is present, possible faulty board. |
| Operator will not run. Power LED is ON. | • Insure that a minimum of one (1) entrapment protection device is connected and the input it is connected to is enabled (UL 325-DIP switch is ON).  
• Press “Push to Operate” button or momentarily jumper terminal 1 to terminal 2 (or 1 to 6). If the input LED does not come ON, check the terminal strip or replace the circuit board. If LED does come ON, proceed to next steps.  
• **Check Motor:** Gate must be halfway open before testing motor.  
  1. **Turn AC power** OFF and remove plug P2 from circuit board. On the P2 terminal, connect terminal 1 to terminal 5 and terminal 2 to terminal 6. Turn AC power ON – **CAUTION – HIGH VOLTAGE.** The motor should run, turn power OFF.  
  2. **With AC power still OFF.** Connect terminal 1 to terminal 6, and terminal 2 to terminal 5. Turn AC power ON – **CAUTION – HIGH VOLTAGE.** The motor should run in the opposite direction as terminal 1 to terminal 5 and terminal 2 to terminal 6, turn power OFF.  
  3. If the motor does not run, or runs in only one direction, problem can be a bad motor, wire connections from the control board to the motor or a bad control board. If the motor runs in both steps above, continue troubleshooting control board and accessories. |

</tbody>
</table>
6.3 Built-in Diagnostics

This gate operator is designed with built-in diagnostics that will alert you to potential or existing problems that the microprocessor has detected. Specific fault conditions are checked and the operator will signal that a fault exist through the built-in alarm.

**Constant tone is heard when power is applied**: This indicates that the limit switch wire harness is not connected to the circuit board. In this condition, the operator will not run and the tone will continue until the fault is corrected. Check to be sure that the limit switch plug is properly inserted into P3.

**Constant tone is heard**: This indicates that the operator is in a hard shutdown condition. The tone will continue to sound for five minutes, and then will beep once every five seconds. The alarm reset button must be pressed or power must be removed and then reapplied to return the operator to normal operation.

**Short tone is heard every five seconds**: This indicates that the operator has been in a hard shutdown condition in excess of five minutes. This will continue until the alarm reset button is pressed or until power is removed from the operator.

**Operator runs for 1 second and stops, two short tones are heard**: This indicates that there may be a fault with the current sensor circuit. Check that the black current sensor wire has been passed through the hole in the current sensor donut with the correct number of loops (1/2 HP motor - 2 loops, 1 HP motor - 1 loop).
6.4 Accessory Items

UL 325 Monitored Entrapment Protection Devices available for the model 6524 swing gate operator.

**Type B2 Contact Sensors (Reversing Edge)**
- Miller Edge Sensing Edges - all models with a T2 (resistive) termination.
- Miller Edge wireless monitored transmitter/receiver kit model RB-G-K10
- ASO GMBH Sentir GF Series sensing edges

**Type B1 Non-contact Sensors (Photo Cell)**
- Miller Edge Reflective-Guard Model RG
- Miller Edge Prime-Guard Model PG
- EMX Industries Model IRB-MON
- EMX Industries Model IRB-RET
- Omron Model E3K-R10K4
- Seco-Larm Model E-936-S45RRGQ
- Seco-Larm Model E-960-D90GQ

**Monitored Expansion Kit**
- Miller Edge Multi-Input Module Model MIM-62

Accessory items available for the model 6524 swing gate operator.

**Plug-In Loop Detector** - Detectors plug directly into ports on circuit board simplifying wiring.
- Single channel detector - P/N 9410-010
- Dual channel detector - P/N 9409-010
- Single channel detector with aux relay - P/N 9411-010
- Single channel low power draw detector - P/N 9416-010
- Dual channel low power draw detector - P/N 9415-010

**External Loop Detector**
- Reno A&E 12/24 VDC or 24 VAC - 9402-045
- Reno A&E 120 VAC - 9402-047
- Carlo Gavazzi 24 VAC/VDC - 9402-044
- Diablo 10-30 VAC/VDC low power draw - 9402-050

**Magnetic Lock** - Magnetic Gate Lock Kit provides an excellent means to secure swing gates and is a fail-safe device allowing emergency vehicle access upon power outage.
- P/N 1216-080 and P/N 1216-081

**Control Station** - Interior station mounts into single-gang electrical box. Provides open and hold open manual operation of the gate.
- P/N 1200-017.

**115 VAC Heater and Fan Assembly** - Cold weather climates where temperatures drop below 40°F (4°C). For 115 VAC input power ONLY.
- P/N 6500-480

**RS-485 Communication Cable** - Interconnect primary / secondary operators (Bi-Parting Gates ONLY).
- P/N 9024-136

**Time Clock** - 7 day time clock can be used to automatically open gate at pre-set time and days. Compact clock fits inside the operator.
- P/N 2600-791 - 7 day clock

**Uphill Arm Pivot Assembly** - Ball joint pivot gate connection used on uphill or downhill opening swing gates.
- P/N 6500-490

**Torsion Rods** - Torsion rod assembly is used on uphill swing gates for counter balance.
- P/N 1200-084

**Hinges** - Heavy-duty ball bearing hinges provide easy swing gate operation.
- P/N 1200-009, P/N 1200-019, P/N 1200-039.

**Surge Devices** - High and low voltage surge suppressors help prevent circuit board failure caused by lightning strikes and power surges.
- P/N 1879-010 - High Voltage
- P/N 1878-010 - Low Voltage

**Speed Bumps** - Prefabricated six-foot speed bump reduces traffic speed through gate system. P/N 1610-150

**Standard Battery** - 12 Volt 7.2 Amp/Hr. P/N 1801-003. Two (2) required.

**12 Volt 18 Amp/Hr Extended Battery** - P/N 1801-004. Two (2) required.
6.5 Gearbox Shaft Extension Replacement

**Drive Arm Only** P/N 6500-255
**Control Arm Only** P/N 2600-714
**Elbow Assy ONLY** P/N 2600-720
**Complete Arm Kit** P/N 6500-430

**Limit Sensor Assemblies** Loosen set screws on plastic limit assemblies to remove them. Be CAREFUL not to damage limit sensor wires after the assemblies have been removed. **Note:** Close Limit Sensor must be reinstalled on TOP of Open Limit Sensor.

**Hub Assembly** Remove the TWO bolts to remove hub assembly from hub extension shaft.

**Brass Bushing** P/N 6500-145
**Brass Bushings** P/N 6500-145

**Hub Extension Shaft Assembly** P/N 6500-162

**Snap Ring Channel**

**Limit Sensors Collar** P/N 6500-117
Remove the FOUR bolts to remove collar.

**Brass Bushing** P/N 6500-138

**Bushing Lock Plate** P/N 6500-123
**Stainless Steel Washer** P/N 2620-075

**Limit Sensors**

**Limit Sensor P/N 1601-263**

**Limit Sensor P/N 1601-263**

**Open Bracket Limit Sensor P/N 1601-261**

**Limit Sensor Assemblies** Loosen set screws on plastic limit assemblies to remove them. Be CAREFUL not to damage limit sensor wires after the assemblies have been removed. **Note:** Close Limit Sensor must be reinstalled on TOP of Open Limit Sensor.

**Hub Assembly** Remove the TWO bolts to remove hub assembly from hub extension shaft.

**Brass Bushing** P/N 6500-145
**Brass Bushings** P/N 6500-145

**Hub Extension Shaft Assembly** P/N 6500-162

**Snap Ring Channel**

**Limit Sensors Collar** P/N 6500-117
Remove the FOUR bolts to remove collar.

**Brass Bushing** P/N 6500-138

**Bushing Lock Plate** P/N 6500-123
**Stainless Steel Washer** P/N 2620-075

**Limit Sensors**

**Limit Sensor P/N 1601-263**

**Limit Sensor P/N 1601-263**

**Open Bracket Limit Sensor P/N 1601-261**

**Limit Sensors**

**Limit Sensors Collar** P/N 6500-117
Remove the FOUR bolts to remove collar.
SECTION 7 - OWNER OF THE GATE OPERATOR

7.1 Alarm Sounding and Gate WILL NOT Operate

A KEY has been supplied that will unlock the power switch cover on this gate operator.

Note: The owner of the gate operator is responsible for the KEY availability.

When alarm is sounding .. ALWAYS CHECK GATE AREA FOR ANY OBSTRUCTIONS FIRST.

If the cause of the alarm cannot be corrected, shut-off power and DO NOT place this operator back into service until the malfunction can be identified and CORRECTED.

IMPORTANT: Putting this gate operator back into service without CORRECTING the cause of the alarm could result in serious injury or DEATH!

Gate Operator is in a Hard Shutdown Condition when Alarm is Sounding

This occurs when:
1. The inherent entrapment protection system (Type A) gets activated TWO consecutive times before the gate completes the open or close cycle.
2. The reversing edge contact sensor (Type B2) gets activated and reverses but before the gate completes the reverse cycle the inherent entrapment protection system (Type A) gets activated.

The audio alarm will sound for five minutes, or until the operator’s reset button is pushed. After (5) five minutes the alarm will “chirp every 5 sec.” and the hard shutdown condition will remain in affect until the reset button is pushed.

Please read SECTION 5 - OPERATING INSTRUCTIONS for more information about operating this gate operator.
7.2 Manual Gate Operation

**Caution:** NEVER attempt to manually operate the gate until you have VERIFIED that power to the gate operator has been SHUT-OFF!

A KEY has been supplied that will unlock the cover and power switch cover on this gate operator.

**Note:** The owner of the gate operator is responsible for the KEY availability.

A. Unlock the cover and rotate sliding door.

B. Remove release tool and place where shown.

C. Release hub. Gate can now be manually operated.

Please read **SECTION 5 - OPERATING INSTRUCTIONS** for more information about operating this gate operator.
7.3 Gate Operator’s Monthly Checkup

**Caution:** Make SURE gate area is clear BEFORE testing the gate operator!

**DO NOT** repair or adjust gate systems yourself. Contact a trained gate systems technician with any questions or to make any repairs or adjustments. If you feel uncomfortable performing any of these inspections or testing, a qualified service technician will perform the visual inspections and testing for you. You can find a trained service technician at DoorKing’s “Dealer Locator” at www.doorking.com

**Visual Inspection**

Visually inspect the rollers, fasteners, brackets and other gate hardware for proper alignment, proper tightness, and signs of damage, breakage, looseness, rust or wear. Moving parts should be lubricated and should not be squeaking. Visually inspect wiring for fraying or exposure. If a malfunction is found, contact a trained service technician to make adjustments or repairs.

**Test Built-In Reversing Sensor**

Begin with the gate in the fully **OPEN** position. Stand just outside the path of the gate and close the gate (typically auto-timer will time-out and close gate automatically). As the gate is **closing**, firmly press a solid object against the end of the gate frame in the direction opposing the travel of the gate. The gate should **stop** within 2 sec. and **reverse** to the **OPEN** position. Another input command is needed before the gate will reset and close again. Repeat this test while **opening** the gate. Start from the fully **CLOSED** position. While **opening**, gate should **stop** and **reverse** to the **CLOSE** position. If gate does **NOT** respond like it should in either direction of gate travel, contact a trained service technician to make adjustments or repairs.

**Test Photo Sensors**

If the gate has a photo sensing device protecting the path of a **closing gate**, perform the following test. Begin with the gate in the fully **OPEN** position. Stand just outside the path of the gate and close the gate (typically auto-timer will time-out and close gate automatically). Pass an object across the path of the closing photo sensing beam. The gate should **stop** within 2 sec. and **reverse** to the **OPEN** position. Typically the auto-timer times out and gate closes again.

If the gate has a photo sensing device protecting the path of a **opening gate**, start from the fully **CLOSED** position. **OPEN** gate. Pass an object across the path of the opening photo sensing beam. The gate should **stop**, the gate will resume opening when the beam is clear. If gate does **NOT** respond like it should in either direction of gate travel, contact a trained service technician to make adjustments or repairs.

**Test Reversing Edges**

If the gate has a reversing edge(s) protecting the path of a **closing gate**, perform the following test. Begin with the gate in the fully **OPEN** position. Stand just outside the path of the gate and close the gate. As the gate is closing, firmly press a solid object against the reversing edge in the direction opposing the travel of the gate. The gate should **stop** within 2 sec. and **reverse** to the **OPEN** position (typically auto-timer will time-out and close gate automatically). If the gate encounters another obstruction before it is closed, the gate will **stop** and reverse to the **OPEN** position **again**. A input command is needed before the gate will reset and close again, auto-timer will **NOT** close gate (Typically, press your remote button for input command). If the gate has a reversing edge(s) protecting the path of a **opening gate**, starting from the fully **CLOSED** position. Stand just outside the path of the gate and open the gate. **OPEN** gate. As the gate is opening, firmly press a solid object against the reversing edge in the direction opposing the travel of the gate. gate should **stop** and **reverse** to the **CLOSE** position. If gate does **NOT** respond like it should in either direction of gate travel, contact a trained service technician to make adjustments or repairs.

**Note:** This gate operator uses high levels of force to move the gate and most people underestimate the power of these systems and do not realize the potential hazards associated with this system if **NOT** maintained properly.

Scheduled maintenance visits are offered by most qualified service technicians to **MAINTAIN** your gate operator system.
Gate Operator is in a Hard Shutdown Condition when Alarm is Sounding

This occurs when:

1. The inherent entrapment protection system (Type A) gets activated TWO consecutive times before the gate completes the open or close cycle.
2. The reversing edge contact sensor (Type B2) gets activated and reverses but before the gate completes the reverse cycle the inherent entrapment protection system (Type A) gets activated.

If the cause of the alarm cannot be corrected, shut-off power and DO NOT place this operator back into service until the malfunction can be identified and CORRECTED.

IMPORTANT: Putting this gate operator back into service without CORRECTING the cause of the alarm could result in serious injury or DEATH!

To obtain key to unlock gate operator contact:

Name
Phone #

Warning:
NEVER attempt to manually operate the gate until you have VERIFIED that power to the gate operator has been SHUT-OFF.

Manual Gate Operation

Gate can now be manually operated.

Release hub.

Remove release tool and place where shown.

Unlock the cover and rotate sliding door.

When alarm is sounding:

ALWAYS CHECK GATE AREA FOR ANY OBSTRUCTIONS FIRST!

Gate will NOT operate and alarm will continue to sound.
Entrainment Protection must be provided for the gate system where the risk of entrapment or obstruction exists. The operator will not run without one or more monitored type B1 or B2 entrainment protection devices.
