Entrainment Protection must be provided for the gate system where the risk of entrainment or obstruction exists. The operator will NOT run without one or more monitored type B1 or B2 entrainment protection devices in EACH direction of gate travel.

UL 325 August 2018 Standard

Conforms To UL STD 325
Certified To CSA STD C22.2 # 247
The two DIP-switches located on the circuit board are used to program the operator to operate in various modes and to turn on or off various operating features. Whenever a switch setting is changed, power to the operator must be turned OFF and then turned back on for the new setting to take affect. Check and review ALL switch settings prior to applying power to the operator.

Quick Guide - 2

QUICK GUIDE: Terminal Descriptions

See page 30 for terminal wiring.

4-Pin Non-Removable Terminal

Notes:
- Use a standard 4-wire 3-button control station. DoorKing's 3-wire 3-button control station cannot be used.
- When using a 3-button control station AND a interlock device together, #3 terminal (N.C.) must be wired in series.
- See page 30 for wiring.

3-Pin with Jumper

Jumper on bottom 2 pins when using 4-pin terminal.

Jumper on top 2 pins when NOT using 4-pin terminal.

20-Pin Main Terminal

- Low Voltage Common
- Full Open
- 24 VAC - 250 mA max. (See note below)
- Full Open
- Standard Reverse or Stop
- Gate Tracker Data
- Gate Tracker Busy
- 24 VDC Mag Lock Power
- Dry Relay Contact
- Dry Relay Contact
- Low Voltage Common
- Low Voltage Common
- Entrapment Alarm
- Alarm Reset
- Secondary Current Sensor
- Motor
- Circuit Board Power
- Circuit Board Power

Notes:
- Use a standard 4-wire 3-button control station. DoorKing's 3-wire 3-button control station cannot be used.
- When using a 3-button control station AND a interlock device together, #3 terminal (N.C.) must be wired in series.
- See page 30 for wiring.

Main Terminal #3 Note:
Exceeding 250 mA of power from this terminal may cause the circuit board transformer to overheat, causing intermittent problems.

Switches:
- SW 1
- SW 2

Relay Contacts

Operation of relay is dependent on setting of SW 1, switches 7 and 8. Relay contacts can be set for Normally Open (N.O.) or Normally Closed (N.C) operation.

Contact rating is 1 amp maximum at 24-volts DC.

For dual operator applications ONLY. Allows the secondary reversing sensor to monitor the current flow into the secondary operator. See page 24 for more information.

UL 325 Terminal Pages 26-28

For dual operator applications ONLY.

24-volt DC magnetic lock power is provided constantly except when the gate is opening or open (Normally Closed function). 1 Amp Max.

Notes:
- When gate is closing: SW 1, switch 5 is OFF, an input to terminal #6 (N.O.) will reverse and open the gate.
- When gate is closing: SW 1, switch 5 is ON, an input to terminal #6 (N.O.) will stop the gate, then continue to close the gate when input is clear (Used to help prevent tailgating vehicles from unauthorized entry). See page 21 for more information.
OPERATOR SPECIFICATIONS

Use this manual for the Model 9000 operators with circuit board 4405-018 Rev A or higher ONLY.

Class of Operation: UL 325 Class I, II, III, IV
Type of Gate: Vehicular Slide Gates Only
Drive Sprocket Size: #40 Chain
Inherent Entrapment Protection Device: Inherent Reverse Sensor System (Type A)
External Entrapment Protection Device Inputs: Connection inputs for Non-contact Sensor - Photo Sensor (Type B1), Connection input for Contact Sensor - Reversing Edge (Type B2)

Entrapment Protection must be provided for the gate system where the risk of entrapment or obstruction exists. The operator will NOT run without one or more monitored type B1 or B2 external entrapment protection devices in EACH direction of gate travel (minimum of 2 external devices required).

Gate Installed Level

<td>1 Ft/Sec</td>
</tr>
</tbody>
</table>

Note: 208/230/460/575 VAC input voltage can be connected to the operator by installing an “Optional” High Voltage Kit on the PRIMARY operator ONLY (P/N 2600-266).

Type of wiring to be used on ALL external devices:
A) Type CL2, CL2P, CL2R, or CL2X
B) Other cable with equivalent or better electrical, mechanical, and flammability ratings.

| 4.2 Entrapment Protection Device Locations | 26-27 |
| 4.3 Loop Detector Wiring | 28 |

## SECTION 5 - MAIN TERMINAL WIRING

| 5.1 Terminal Descriptions | 29 |
| 5.2 Control Wiring | 30 |

## SECTION 6 - OPERATING INSTRUCTIONS

| 6.1 Operator Controls and Resets | 31 |
| 6.2 Shutdown Conditions | 32 |
| 6.3 Manual Gate Operation | 33 |

## SECTION 7 - MAINTENANCE AND TROUBLESHOOTING

| 7.1 Maintenance | 34 |
| 7.2 Built-In Diagnostics | 34 |
| 7.3 Troubleshooting | 35-36 |
| 7.4 Accessory Items | 37-38 |
| Model 9000 Wiring Diagrams | 39-40 |

## SECTION 8 - OWNER OF THE GATE OPERATOR

| 8.1 Alarm Sounding and Gate WILL NOT Operate | 41 |
| 8.2 Manual Gate Operation | 42 |
| 8.3 Gate Operators Monthly Checkup | 43 |
| Printable Safety Page | 45 |
Slide Gate Requirements

The operator is intended for installation only on gates used for vehicles. Pedestrians must be supplied with a separate access opening. The pedestrian access opening shall be designed to promote pedestrian usage. Locate the gate such that persons will not come in contact with the vehicular gate during the entire path of travel of the vehicular gate.

All openings of a horizontal slide gate are guarded or screened from the bottom of the gate to a minimum of six (6) feet (1.83 m) above the ground to prevent a 2 1/4 inch (57.2 mm) diameter sphere from passing through the openings anywhere in the gate and in that portion of the adjacent fence that the gate covers in the open position.

Note: A filler post or barrier may need to be installed in the gap area to reduce the distance to 2 1/4 inches or less. A contact sensor should be installed in this area for safety. (See A on next page and page 26).

DoorKing recommends installing screened wire mesh on the ENTIRE gate AND and on that portion of the adjacent fence that the gate covers in the open position. (See above).
Safety Information for Slide Gate Operators

Entrapment protection devices are required to reduce the risk of injury. Install sensors where the risk of entrapment or obstruction exists while gate is moving. Individual requirements will vary. See pages 25-28 for more information on typical layout locations and setup.

Non-Contact Sensors (Photo Sensors)

1. Helps minimize the potential of entrapment during the closing cycle of the gate. Minimizes the potential of the gate closing on vehicular or other traffic that loops cannot sense. It can be installed on the secure OR non-secure side of gate.

2. Helps minimize the potential of entrapment during the back travel of the gate (opening cycle). See previous page for gate gap information.

Contact Sensor (Reversing Edges)

A. Installed on the fence to help minimize the potential of entrapment between the gate and fence during the opening cycle of the gate. A filler post or barrier MAY need to be installed between fence and gate.

B. Helps minimize the potential of entrapment during the back travel of the gate (opening cycle).

C. Helps minimize the potential of entrapment during the closing cycle of the gate. Minimizes the potential of the gate closing on vehicular or other traffic that loops cannot sense.

Guide Rollers

See previous page for more information.

Automatic Exit Loop

(Optional) will provide an open command to the gate operator(s) when a vehicle is exiting the property.

Reverse Loop

Minimizes the potential of the gate closing when a vehicle is present. Number and placement of loops is dependent on the application.

Reverse Loop

Minimizes the potential of the gate closing when a vehicle is present. Number and placement of loops is dependent on the application.

External entrapment protection devices are REQUIRED for operator to function. See page 25.

Screened Wire Mesh

May be necessary on part of fence AND entire gate. See previous page for more information.

Warning Sign

Moving gate can cause serious injury or death. Keep clear! May move at any time without prior warning. Do not let children operate the gate or play in the gate area. This entrance is for vehicles only. Pedestrians must use separate entrance.

Physical Stop

Positive stops shall be required to limit travel to the designed fully open and fully closed positions. These stops shall be installed either at the top of the gate, or at the bottom of the gate where such stops shall horizontally or vertically project no more than is required to perform their intended function.

Physical Stops

Permanently mounted and easily visible from either side of the gate.
ASTM F2200 Standard for Gate Construction

Vehicular gates should be constructed and installed in accordance with ASTM F2200; Standard Specification for Automated Vehicular Gate Construction. For a copy of this standard, contact ASTM directly at 610-832-9585; service@astm.org; or www.astm.org.

Important Safety Instructions

**WARNING - To reduce the risk of injury or death:**

1. **READ AND FOLLOW ALL INSTRUCTIONS.**
2. Never let children operate or play with gate controls. Keep the remote control away from children.
3. Always keep people and objects away from gate. **NO ONE SHOULD CROSS THE PATH OF THE MOVING GATE.**
4. Test the operator monthly. The gate MUST reverse on contact with a rigid object or stop or reverse when an object activates the non-contact sensors. After adjusting the force or the limit of travel, retest the gate operator. Failure to adjust and retest the gate operator properly can increase the risk of injury or death.
5. Use the emergency release only when the gate is not moving.
6. **KEEP GATES PROPERLY MAINTAINED.** Read the owner’s manual. Have a qualified service person make repairs to gate hardware.
7. The entrance is for vehicles only. Pedestrians must use separate entrance.
8. **SAVE THESE INSTRUCTIONS!**

Instructions regarding intended installation:

- Install the gate operator only if:
  1. The operator is appropriate for the construction of the gate and the usage class of the gate.
  2. All openings of a horizontal slide gate are guarded or screened from the bottom of the gate to a minimum of 6 feet (1.83 m) above the ground to prevent a 2 ¼ inch (57.2 mm) diameter sphere from passing through the openings anywhere in the gate, and in that portion of the adjacent fence that the gate covers in the open position.
  3. All exposed pinch points are eliminated or guarded.
  4. Guarding is supplied for exposed rollers.
- The operator is intended for installation only on gates used for vehicles. Pedestrians must be supplied with a separate access opening. The pedestrian access opening shall be designed to promote pedestrian usage. Locate the gate such that persons will not come in contact with the vehicular gate during the entire path of travel of the vehicular gate.
- The gate must be installed in a location so that enough clearance is supplied between the gate and adjacent structures when opening and closing to reduce the risk of entrapment. Swinging gates should not open into public access areas.
- The gate must be properly installed and work freely in both directions prior to the installation of the gate operator. Do not over-tighten the operator clutch, pressure relief valve or reduce reversing sensitivity to compensate for a damaged gate.
- For gate operators utilizing Type D protection:
  1. The gate operator controls must be placed so that the user has full view of the gate area when the gate is moving.
  2. A warning placard shall be placed adjacent to the controls.
  3. An automatic closing device (such as a timer, loop sensor, or similar device) shall not be employed.
  4. No other activation device shall be connected.
- Controls intended for user activation must be located at least six feet (6’) away from any moving part of the gate and where the user is prevented from reaching over, under, around or through the gate to operate the controls. Outdoor or easily accessible controls should have a security feature to prevent unauthorized use.
- The Stop and/or Reset button must be located in the line-of-sight of the gate. Activation of the reset control shall not cause the operator to start.
- A minimum of two (2) **WARNING SIGNS** shall be installed, one on each side of the gate where easily visible.
- For gate operators utilizing a non-contact sensor:
  1. See the instructions on the placement of non-contact sensors for each type of application.
  2. Care shall be exercised to reduce the risk of nuisance tripping, such as when a vehicle trips the sensor while the gate is still moving in the opening direction.
  3. One or more non-contact sensors shall be located where the risk of entrapment or obstruction exist, such as the perimeter reachable by a moving gate or barrier.
- For gate operators utilizing contact sensors:
  1. One or more contact sensors shall be located where the risk of entrapment or obstruction exist, such as at the leading edge, trailing edge, and post mounted both inside and outside of a vehicular horizontal slide gate.
  2. One or more contact sensors shall be located at the bottom edge of a vehicular vertical lift gate.
  3. One or more contact sensors shall be located at the pinch point of a vehicular vertical pivot gate.
  4. A hardwired contact sensor shall be located and its wiring arranged so that the communication between the sensor and the gate operator is not subjected to mechanical damage.
  5. A wireless contact sensor such as one that transmits radio frequency (RF) signals to the gate operator for entrapment protection functions shall be located where the transmission of the signals are not obstructed or impeded by building structures, natural landscaping or similar obstructions. A wireless contact sensor shall function under the intended end-use conditions.
  6. One or more contact sensors shall be located at the bottom edge of a vertical barrier (arm).
- Be sure you have instructed the owner of the gate operator about safe and proper operation and testing of the gate operator.
Vehicular gate operator products provide convenience and security. However, gate operators must use high levels of force to move gates and most people underestimate the power of these systems and do not realize the potential hazards associated with an incorrectly designed or installed system. These hazards may include:

- Pinch points
- Entrapment areas
- Reach through hazards
- Absence of entrapment protection devices
- Improperly located access controls
- Absence of vehicle protection devices
- Absence of controlled pedestrian access

In addition to these potential hazards, automated vehicular gate systems must be installed in accordance with the UL 325 Safety Standard and the ASTM F2200 Construction Standard. Most people are unaware of, or are not familiar with, these standards. If an automated vehicular gate system is not properly designed, installed, used and maintained, serious injuries or death can result. Be sure that the installer has instructed you on the proper operation of the gate and gate operator system.

Be sure that the installer has trained you on proper and safe operation of this gate operating system and about the basic functions of the required reversing systems associated with your gate operating system and how to test them (see section 8). These include reversing loops, inherent reversing system, electric edges, photoelectric cells, or other external devices.

- This Owner's Manual is your property. Keep it in a safe place for future reference.
- Be sure that all access control devices are installed a minimum distance of 6 feet away from the gate and gate operator, or in such a way that a person cannot touch the gate or gate operator while using the device. If access control devices are installed in violation of these restrictions, immediately remove the gate operator from service and contact your installing dealer.

- Loops and loop detectors, photo-cells or other equivalent devices must be installed to prevent the gate from closing on vehicular traffic.
- The speed limit for vehicular traffic through the gate area is 5 MPH. Install speed bumps and signs to keep vehicular traffic from speeding through the gate area. Failure to adhere to posted speed limits can result in damage to the gate, gate operator, and to the vehicle.
- Be sure that all persons who will use the gate system are familiar with the proper use of the gate and gate operator and are familiar with the possible hazards associated with the gate system.
- Be sure that warning signs are permanently installed on both sides of the gate in an area where they are fully visible to traffic.
- It is your responsibility to periodically check all entrapment protection devices. If any of these devices are observed to function improperly, remove the operator from service immediately and contact your installing or servicing dealer.
- Follow the recommended maintenance schedule.
- Do not allow children to play in the area of the operator or to play with any gate-operating device.
- To remove the gate operator from service, operate the gate to the full open position and then shut off power to the operator at the service panel.

**UL 325 Entrapment Protection**

**UL 325 Classifications**

### Class I - Residential Vehicular Gate Operator
A vehicular gate operator (or system) intended for use in garages or parking areas associated with a residence of one-to four single families.

### Class II - Commercial/General Access Vehicular Gate Operator
A vehicular gate operator (or system) intended for use in a commercial location or building such as a multi-family housing unit (five or more single family units), hotel, garages, retail store, or other buildings accessible by or servicing the general public.

### Class III - Industrial/Limited Access Vehicular Gate Operator
A vehicular gate operator (or system) intended for use in an industrial location or building such as a factory or loading dock area or other locations not accessible by or intended to service the general public.

### Class IV - Restricted Access Vehicular Gate Operator
A vehicular gate operator (or system) intended for use in a guarded industrial location or building such as an airport security area or other restricted access locations not servicing the general public, in which unauthorized access is prevented via supervision by security personnel.

---

**Gate Operator Category**

**Effective January 12, 2016**

<table>
<thead>
<tr>
<th>Horizontal Slide, Vertical Lift, Vertical Pivot</th>
<th>Swing, Vertical Barrier (Arm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Entrainment Protection Types</td>
<td>A, B1*, B2*, C or D</td>
</tr>
</tbody>
</table>

- **Type A** - Inherent entrapment protection system.
- **Type B1** - Non-contact sensor (photoelectric sensor or the equivalent).
- **Type B2** - Contact sensor (edge device or equivalent).
- **Type C** - Inherent force limiting, inherent adjustable clutch or inherent pressure relief device.
- **Type D** - Actuating device requiring constant pressure to maintain opening or closing motion of the gate.

* B1 and B2 means of entrapment protection must be MONITORED.

Vertical Barrier Note: Barrier gate operators (arm) that is not intended to move toward a rigid object closer than 16 inches (406 mm) are not required to be provided with a means of entrapment protection.
**Glossary**

**GATE** - A moving barrier such as a swinging, sliding, raising, lowering, or the like, barrier, that is a stand-alone passage barrier or is that portion of a wall or fence system that controls entrance and/or egress by persons or vehicles and completes the perimeter of a defined area.

**RESIDENTIAL VEHICULAR GATE OPERATOR – CLASS I** - A vehicular gate operator (or system) intended for use in a home of one-to-four single family dwelling, or garage or parking area associated therewith.

**COMMERCIAL / GENERAL ACCESS VEHICULAR GATE OPERATOR - CLASS II** - A vehicular gate operator (or system) intended for use in a commercial location or building such as a multi-family housing unit (five or more single family units), hotels, garages, retail store, or other building servicing the general public.

**INDUSTRIAL / LIMITED ACCESS VEHICULAR GATE OPERATOR - CLASS III** - A vehicular gate operator (or system) intended for use in an industrial location or building such as a factory or loading dock area or other locations not intended to service the general public.

**RESTRICTED ACCESS VEHICULAR GATE OPERATOR - CLASS IV** - A vehicular gate operator (or system) intended for use in a guarded industrial location or building such as an airport security area or other restricted access locations not servicing the general public, in which unauthorized access is prevented via supervision by security personnel.

**VEHICULAR BARRIER (ARM) OPERATOR (OR SYSTEM)** - An operator (or system) that controls a cantilever type device (or system), consisting of a mechanical arm or barrier that moves in a vertical arc, intended for vehicular traffic flow at entrances or exits to areas such as parking garages, lots or toll areas.

**VEHICULAR HORIZONTAL SLIDE-GATE OPERATOR (OR SYSTEM)** - A vehicular gate operator (or system) that controls a gate which slides in a horizontal direction that is intended for use for vehicular entrance and exit to a drive, parking lot, or the like.

**VEHICULAR SWING-GATE OPERATOR (OR SYSTEM)** - A vehicular gate operator (or system) that controls a gate which moves in an arc in a horizontal plane that is intended for use for vehicular entrance and exit to a drive, parking lot, or the like.

**SYSTEM** - In the context of these requirements, a system refers to a group of interacting devices intended to perform a common function.

**WIRED CONTROL** - A control implemented in a form of fixed physical interconnections between the control, the associated devices, and an operator to perform predetermined functions in response to input signals.

**WIRELESS CONTROL** - A control implemented in means other than fixed physical interconnections (such as radio waves or infrared beams) between the control, the associated devices, and an operator to perform predetermined functions in response to input signals.

**INHERENT ENTRAPMENT PROTECTION SYSTEM** - A system, examples being a motor current or speed sensing system, which provides protection against entrapment upon sensing an object and is incorporated as a permanent and integral part of the operator.

**EXTERNAL ENTRAPMENT PROTECTION DEVICE** - A device, examples being an edge sensor, a photoelectric sensor, or similar entrapment protection device, which provides protection against entrapment when activated and is not incorporated as a permanent part of an operator.

**ENTRAPMENT** - The condition when an object is caught or held in a position that increases the risk of injury.
SECTION 1 - INSTALLATION

Prior to beginning the installation of the slide gate operator, we suggest that you become familiar with the instructions, illustrations, and wiring guide-lines in this manual. This will help insure that your installation is performed in an efficient and professional manner compliant with UL 325 safety and ASTM F2200 construction standards.

The proper installation of the vehicular slide gate operator is an extremely important and integral part of the overall access control system. Check all local building ordinances and building codes prior to installing this operator. Be sure your installation is in compliance with local codes.

1.1 Hardware for the Gate

Good hardware is essential for proper operation of a sliding gate. DoorKing has a full line of gate hardware products that will ensure safe, reliable and long lasting gate operation. The gate must be properly installed and roll smoothly in both directions.

- **Roller Bearing V-Wheels with Protective Cover** - Helps to minimize a pinch point on the gate's wheel and V-rail.
- **Guide Rollers with Protective Covers** - Helps to minimize a pinch point on the gate.
- **Endless Idler Assembly with Protective Cover** - Helps to minimize a pinch point for a 180° chain return.
- **Gate End Retainer** - Helps stabilize the end of the gate in the open or closed position.

1.2 Underground Conduit Requirements

- The conduit requirements are for a typical slide gate operator installation (the secondary operator is shown for those applications where a secondary operator may be used). The conduit requirements for your application may vary from this depending on your specific needs.
- Use only sweeps for conduit bends. Do not use 90° elbows as this will make wire pulls very difficult and can cause damage to wire insulation. DoorKing recommends using 3/4-inch conduit.
- External Entrapment Protection is **REQUIRED** (photo sensor and/or reversing edge).
- Be sure that all conduits are installed in accordance with local codes.
- Never run low voltage rated wire insulation in the same conduit as high voltage rated wire insulation.
1.3 Typical Gate Types

The Model 9000 operator is designed to be installed on any of these gate types. See the next 3 pages for specific operator mounting positions.

- Steel or Aluminum.
- 1,500 lb max. weight per gate (1 HP motor).
- Chain tray recommended for gates over 20 ft. (Post mount installation when using a chain tray.)
- Single operator - 35 ft max gate length. Dual operators - 70 ft max gate length.
1.4 Operator Mounting Positions

The Model 9000 operator is designed to be installed in the front, rear and center mounting positions shown on this page and the next 2 pages. V-wheel V-rail ornamental gates are shown as examples but other gate types on the previous page can use the same mounting setups. Once the mounting position has been selected, refer to pages 13 thru 16 for specific installation instructions.

Front Position with Concrete Pad

Standard method of installation.

- Operator’s chain idler wheels are factory set in the top position.

Front Position with Post Mount Kit

Raises operator and allows different chain heights.

- Set operator chain idler wheels in the bottom position.
- Optional chain tray kit may be installed. See page 16 for more information.

See page 13 and the post mount instruction sheet included with the kit for more information about post installation.

Additional hardware required. Post mount kit (P/N 9000-015).
Rear Position with Concrete Pad
Hides the chain from outside the property looking in.

- Set one chain Idler wheel at the top and one in the center position.

Top View

Additional hardware required. Endless idler assembly (P/N 2600-818) and additional chain #40 (P/N 2600-442 - 20 ft. per box) may be needed.

Rear Position with Post Mount Kit
Raises operator and allows different chain heights.

- Set one chain Idler wheel at the center and one in the bottom position.

See page 13 and the post mount instruction sheet included with the kit for more information about post installation.

Additional hardware required. Post mount kit (P/N 9000-015). Endless idler assembly (P/N 2600-818) and additional chain #40 (P/N 2600-442 - 20 ft. per box) may be needed.
**Center Position with Post Mount Kit**

Hides the chain from outside the property looking in. Allows the use of DoorKing’s chain tray kit to attach to gate. This is useful with long gates. It supports the chain’s weight and helps prevent chain “stretching”.

- Set operator chain idler wheels in the bottom position.

Additional hardware required. Post mount kit (P/N 9000-015). Endless idler assembly (P/N 2600-818) and additional chain #40 (P/N 2600-442 - 20 ft. per box) may be needed.

---

**Gate in Open Position**

See page 15 for more information about endless idlers.
1.5 Concrete Pad Setup or Post Mounting

Concrete Pad Setup

Optional Post Mount Kit
DoorKing offers a post mount kit specifically for the Model 9000 (P/N 9000-015). The kit includes a base plate, 2 posts and hardware to attach the operator to the base plate. This kit will raise the operator and allow different chain heights for specific operator applications. Refer to the instruction sheet provided with the kit for concrete foundation size, conduit type and placement. This kit is needed if a chain tray is required to support the chain's weight when a longer gate is used (See page 16 for more information about DoorKing’s chain tray kit).
1.6 Positioning Operator and Chain

- Operator and chain MUST be parallel to gate!
- Chain bracket MUST line up with chain idler wheels!
- Chain brackets MUST be mounted so the chain remains the same height as it is on the idler wheels!

1.7 Attaching Operator and Chain

Attaching Operator to Concrete Pad
DoorKing recommends a minimum of four (4) 3/8" x 2" sleeve anchors (not supplied).

Attaching Operator to Post Mount Plate
Use bolts provided in post mount kit.

Connect Chain Bracket to Gate. Weld completely around bracket. Chain nut and chain bolt should not protrude past gate frame.

Connect Chain to Chain Bracket. Connect chain to chain bolt with master link. Adjust the chain nuts to tighten the chain. The chain should sag no more than one (1) inch per 10 feet of travel. Do not over tighten the chain.
1.8 Endless Idler Assembly (On Select Installations)

DoorKing offers an endless idler assembly with a protective cover designed for the Model 9000 installations (P/N 2600-818). Make sure the endless idler assembly is securely fastened to the wall or post (Depending on which type of installation will be used). Extreme force will be exerted on this assembly during gate cycling.

**Center and Rear Mount Positions (Top View)**

- **Lower chain MUST align with upper chain!**
- Lower chain does NOT align with upper chain.

**Upper and lower chain MUST be the same height as they are on the operator idler wheels.**

**Center Mount Position (Side View)**

- **YES**
- **NO**
- **NO**
- **NO**

- Lower chain mounted Too High.
- Lower chain mounted Too Low.

**Rear Mount Position (Side View)**

- **YES**
- **NO**
- **NO**
- **NO**

- Upper chain mounted Too High.
- Upper chain mounted Too Low.

Lower chain must be 1 inch lower than the endless idler's 180° chain return.

DoorKing offers an endless idler assembly with a protective cover designed for the Model 9000 installations (P/N 2600-818). Make sure the endless idler assembly is securely fastened to the wall or post (Depending on which type of installation will be used). Extreme force will be exerted on this assembly during gate cycling.
1.9 DoorKing’s Chain Tray Kit

A chain tray is recommended for gates longer than 20 ft. to support the weight of the chain. DoorKing offers a chain tray kit in 10 ft. sections to fit any length gate. (DoorKing P/N 2601-270 10 Ft. section)

The Chain tray supporting brackets can be mounted facing up (as shown) or facing down depending on the operator height.

For further information about the chain tray installation, refer to instructions provided with the chain tray kit.

1.10 Installation of Warning Signs

This DoorKing Slide Gate Operator is shipped with two warning signs. The purpose of the warning sign is to alert uninformed persons, and to remind persons familiar with the gate system, that a possible hazard exists so that appropriate action can be taken to avoid the hazard or to reduce exposure to the hazard. See page 3 for suggested mounting positions of signs.

- **Permanently install the supplied warning signs in locations so that the signs are visible by persons on both sides of the gate.**

- **Use appropriate hardware such as wood or sheet metal screws (not supplied) to install the warning signs.**
SECTION 2 - AC POWER TO OPERATOR

Before attempting to connect any wiring to the operator, be sure that the circuit breaker in the electrical panel is in the OFF position. Permanent wiring must be installed to the operator as required by local electrical codes. It is recommended that a licensed electrical contractor perform this work.

Since building codes vary from city to city, we highly recommend that you check with your local building department prior to installing any permanent wiring to be sure that all wiring to the operator (both high and low voltage) complies with local code requirements.

THIS GATE OPERATOR MUST BE PROPERLY GROUNDED!!

2.1 AC Power Wire Runs and Terminal Connection

If power wiring is greater than the maximum distance shown, it is recommended that a service feeder be installed. When large gauge wire is used, a separate junction box must be installed for the operator connection. The wire table is based on stranded copper wire. Wire run calculations are based on an AC power source with a 3% voltage drop on the power line, plus an additional 10% reduction in distance to allow for other losses in the system.

This table illustrates the high voltage AC power wire size and distance limitations.

<table>
<thead>
<tr>
<th>Wire</th>
<th>Max Distance in Feet</th>
</tr>
</thead>
<tbody>
<tr>
<td>12 AWG</td>
<td>10 AWG</td>
</tr>
<tr>
<td>1/2 HP: 115 VAC Single-Phase</td>
<td>170</td>
</tr>
<tr>
<td>1 HP: 115 VAC Single-Phase</td>
<td>100</td>
</tr>
</tbody>
</table>

Reduce the wire distance in half for primary/secondary dual gate application.

“Optional” High Voltage Kit Installation on the 1/2 HP operator ONLY Note: When installing a high voltage kit for the 208/230/460/575 VAC input power on the 1/2 HP operator, refer to the “high voltage AC power wire size and distance limitations” table on the instruction sheet with the high voltage kit (P/N 2600-266) for AC power wire run limitations.

“Optional” Heater Installation Note: When installing a heater, refer to the “high voltage AC power wire size and distance limitations” table on the instruction sheet with the heater kit for AC power wire run limitations.

***Single/Primary Operator***

115 VAC
AC Power Terminal

White - Neutral
Black - 115 VAC Hot
Green - Chassis Ground

Note: “Optional” High Voltage Kit for 1/2 HP operator black and white wires connect the same as shown above.

• Route incoming AC power wire through the high voltage conduit and run wire to the operator electronic box.

• Be sure wiring is installed in accordance with local codes. Be sure to color code all wiring.

• It is recommended that a surge suppressor be installed on the high voltage power lines to help protect the operator and circuit board from surges and power fluctuations.

• Secondary operator in a dual operator application gets power through the 8-wire interconnection cable that links the operators together. See 2.2 Primary/Secondary (dual) gate wiring on next page.

Entrapment Protection must be provided for the gate system where the risk of entrapment or obstruction exists. The operator will NOT run without one or more monitored type B1 or B2 external entrapment protection devices in EACH direction of gate travel (minimum of 2 external devices required).
2.2 Bi-Parting Gates Wiring - Dual Gate Operators

Connect the Primary/Secondary operators together with DoorKing’s interconnection cable (P/N 2600-75x) as shown. High voltage power and low voltage communications are supplied to the secondary operator by DoorKing’s UL approved cable that is run in a single conduit. Two conduits (High voltage and low voltage) will need to be provided to the secondary operator when NOT using DoorKing’s UL listed, wet environment interconnection cable.

Primary Operator Control Board (4405)
- All control, loop detector, safety and auxiliary devices are wired to the primary operator. See page 30 for wiring information.

Secondary Operator Terminal
- Secondary operator contains NO control board.

Primary Operator 8-Pin Secondary Interface Terminal

DoorKing’s UL Listed (Wet Environment) Primary/Secondary Interconnection Cable

Optional Heater Installation Note: If the optional heaters are to be installed on the operators, run two power wires through the interconnection cable conduit to power the secondary operator’s heater. Refer to the instruction sheet in heater kit for more information.
 SECTION 3 - ADJUSTMENTS

The switch settings and adjustments in this chapter should be made after your installation and wiring to the operator(s) is complete. Whenever any of the programming DIP-switches on the circuit board are changed, power must be shut-off, and then turned back on for the new setting to take effect.

3.1 4405 Circuit Board Descriptions and Adjustments

DIP-Switches
Set the DIP-switches on the circuit board to the desired setting. See switch-settings on next 2 pages.

Fire Dept Open
Connect ONLY emergency access controls accessible by authorized personnel (e.g., fire, police, EMS). Upon activation, alarm will sound and the operator will go into a hard shutdown after reaching the open limit. Operator must be reset to resume normal operation. See pages 30, 33.

Auto-Close Timer
Auto-close timer (when turned on) SW 1, switch 4.

How LEDs Function
Illuminated LEDs indicates that low voltage power is being applied to the circuit board.
Input LEDs should be OFF and will only illuminate when the input is activated.
Limit LEDs will only illuminate when the respective limit sensor has been activated.
Loop LEDs will only illuminate when a reverse or exit loop is activated (Vehicle passing over a loop).

Auto-Close Timer

Limit Switch Plug P2
See page 22.

Plugs MUST be plugged in.

Primary/Secondary Interface Terminal Plug

Inherent Reverse Sensors
Adjust reversing sensitivity for the open AND close direction of the PRIMARY (single) and SECONDARY (dual) operators, See page 23.

Secondary Current Sensor
Uses a sensing coil with a given number of wire turns through it to monitor the current flow of the primary operator motor.
Factory Set: 1/2 HP Motor - 2 Turns 1 HP Motor - 1 Turn
See page 24.

Secondary Current Sensor

Primary Current Sensor
Uses a sensing coil with a given number of wire turns through it to monitor the current flow of the primary operator motor.

Dry Relay Contact

Terminals 10-11 can be set for Normally Open (NO) or Normally Closed (NC) operation by placing the relay shorting bar on the N.O. or N.C. pins respectively.

4-Pin Non-Removable Terminal
See page 30.

6-Pin UL 325 Removable Terminal and 4 DIP-Switches
See page 25.

Plug-In Loop Detectors (Sold separately)

See page 28.

4405-018 Side View
### 3.2 DIP-Switch Settings for 4405 Circuit Board

The two DIP-switches located on the circuit board are used to program the operator to operate in various modes and to turn on or off various operating features. Whenever a switch setting is changed, power to the operator must be turned OFF and then turned back on for the new setting to take effect. Check and review ALL switch settings prior to applying power to the operator.

</tbody>
</table>
Switch Definitions

**Switch 1** Must OPEN the primary operator's gate upon initial AC power up and open command. If the first open command begins to close the gate, turn AC power off and reverse this switch.

**Switch 2** Must OPEN the secondary operator's gate upon initial AC power up and open command. If the first open command begins to close the gate, turn AC power off and reverse this switch. This switch will be set the opposite of switch 1 (e.g. If switch 1 is OFF, then switch 2 will be ON).

**Switch 3** Determines that a device wired to terminal #4 is a normal full open command OR terminal #4 becomes the output from the exit loop detector that is plugged into the EXIT Loop port in the circuit board (Used for specialized functions).

**Switch 4** Turns the auto-close timer on or off. Maximum time that the close timer can be set for is approximately 23 seconds.

**Switch 5** Determines if an input to terminal #6 (e.g.: Normally Open N.O.-Photo Sensors, NOT entrapment protection) AND/OR reverse loops will reverse OR stop a CLOSING gate.

A tailgating vehicle can activate terminal #6 and/or reverse loops while the gate is in the closing cycle from the previous vehicle's authorized entry:

- If switch 5 is turned OFF (Reverse), the closing gate that gets activated by a tailgating vehicle will reverse back to the open position, possibly allowing the tailgating vehicle unauthorized entry while the gate is reversing back to the open position.
- If switch 5 is turned ON (Stop), the closing gate that gets activated by a tailgating vehicle will stop, partially or completely blocking the pathway, NOT allowing the tailgating vehicle to enter without proper authorization. The gate will not move until all sensors are clear, usually forcing the tailgating vehicle that activated the sensors to back away from the gate. The gate will then continue until closed, helping prevent the tailgating vehicle from unauthorized entry.

**Switch 6** Sets up the circuit board for a single gate operator or primary / secondary (dual) gate operators.

**Switches 7-8** These work in conjunction with each other and determine when the relay on the board will be activated. This relay can be used as a switch for various functions such as illuminating a warning light when the gate is moving, or turning on a green light when the gate is full open.

**Switch 1** Turning the quick-close feature on will cause the auto close timer to close the gate after 1 second, regardless of the setting of the auto close timer potentiometer. This will also cause an opening gate to stop and reverse when the reverse loops and/or photo sensors are cleared. This feature, along with turning SW 1, switch 5 ON above, is useful to help prevent tailgating vehicles from unauthorized entry.

**Switch 2** If a magnetic lock is not used with the gate operator, leave this switch in the OFF position. Turn this switch ON if a magnetic lock is used and connected to terminals 9 and 12. This applies magnetic lock power and logic to these terminals (NC).

**Switch 3** MUST be turned ON for the Model 9000.

**Switch 4** MUST be turned OFF for the Model 9000.
3.3 Limit Switches

Open and Close Limits MUST be Set

The operator normally stops a cycling gate using the open and close limits. If the limits have not been set, the gate could continue beyond its full open and close positions, damaging the gate and operator. **DO NOT** allow this to occur!

Push and hold the lock-plate away from the limit-nuts. Rotate the limit-nuts to the desired gate **FULL** open and close positions. After adjusting, make sure the lock-plate is engaged in the slots on the limit-nuts to prevent them from rotating.

**Note:** If P2 plug is not connected to the circuit board and AC power is turned on, alarm will sound and operator will NOT function.

Limit LEDs

Upper left corner of Circuit Board.

"Opening Direction" DIP-Switch

<table>
<thead>
<tr>
<th><strong>Switch 1 “OFF”</strong></th>

</tr>
<tr>
<td>B = Open Limit</td>
<td>B = Close Limit</td>
</tr>
</tbody>
</table>

Note: SW 1, Switch 2 - Secondary operator “Opening Direction” functions the same as switch 1.
3.4 Inherent Reverse Sensors Adjustment

This vehicular gate operator is equipped with an inherent adjustable reversing sensor (Type A) used as the primary entrapment protection system according to UL 325 standards. The gate will reverse direction after “physically” encountering an obstruction in either the opening or closing gate cycle.

If the Auto-Close Timer (DIP-switch SW 1, switch 4) is ON and the gate physically encounters an obstruction during the CLOSING cycle, it will reverse to the open position and HOLD the gate at this position (Soft shutdown condition). Another input command is needed before the gate will reset and close again.

For the reverse system to function correctly, the gate must be properly installed and work freely in both directions and the limit switches must be properly adjusted before adjusting these sensors. The ideal adjustment will allow the operator to move the gate through its entire travel cycle without reversing, but will reverse upon contact with an obstruction with no more than 40 Lbs of force. This force can be measured with a gate scale.

CAUTION: Keep pedestrians and vehicles clear of the gate while adjusting and testing sensors!

1. Press the “Push to Operate” button to OPEN the gate.

2. While gate is opening, slowly rotate the primary reverse sensor clockwise until the LED lights up and the gate reverses direction. Rotate the primary reverse sensor back counter-clockwise approximately 1/8 turn to decrease the sensitivity (LED will turn off).

3. Press the “Push to Operate” button and CLOSE the gate. Make sure the gate closes completely. If it reverses and opens (LED will turn on), rotate the primary reverse sensor counter-clockwise a little more to decrease the reverse sensitivity (LED will turn off). Cycle the gate a few times to be sure that it cycles completely in both directions, adjusting the primary sensor as necessary.

Dual Operators:
Adjust reverse sensors for each operator when dual operators have been installed.

Note: If the minimum or maximum reverse sensor sensitivity adjustment is reached and the Secondary Operator will not reverse properly, the Secondary Operator Current Sensor’s wire turns will have to be altered. See 3.5 Secondary Current Sensor Adjustment on the next page.

Test the operator reversing sensitivity:
Place an immobile object along the gate path, allowing the gate to strike it while in the open and close cycles. The gate must reverse direction after striking the object. If it does not, increase the reverse sensitivity and repeat this testing until the correct sensitivity has been achieved in BOTH directions. The operator will assume a soft shutdown (Hold the auto-close timer) after striking and reversing the gate which will require pressing the “Push to Operate” button to cycle the operator again.
3.5 Secondary Current Sensor Adjustment (Dual Gates ONLY)

ONLY the PRIMARY gate operator’s “secondary reversing sensor” uses a secondary current sensing device (Located only in the primary operator) to detect any obstructions “physically” encountered in the SECONDARY gate path when using dual gates. The secondary current sensor uses a sensing coil with a given number of turns through it to monitor the current flow into the secondary operator. Each time the wire passes through the coil, it is considered a turn. The number of turns through the sensing coil is dependant on the operating voltage of the operator and the weight of the gate. In general, light weight gates may require additional turns of wire through the secondary current sensor, while heavier gates may require less turns. CAUTION – HIGH VOLTAGE: Be sure power is turned OFF before changing the number of wire turns to the secondary current sensor. When you are setting the secondary reverse sensor (section 3.4 on the previous page) and reach the MAXIMUM sensitivity position on the reverse sensor without activating the secondary operator reversing function, add an additional turn of wire through the secondary current sensor. If you set the secondary reverse sensor to the MINIMUM sensitivity position and the gate will not cycle completely, reduce the number of turns through the secondary current sensor.

**Sample Turns**

<table>
<thead>
<tr>
<th>Secondary Operator Model</th>
<th>Turns</th>
</tr>
</thead>
<tbody>
<tr>
<td>115 - 1/2 HP - Single-Phase</td>
<td>2</td>
</tr>
<tr>
<td>115 - 1 HP - Single-Phase</td>
<td>1</td>
</tr>
</tbody>
</table>

**Typical Number of Turns for Secondary Current Sensor**

- **1 Turn**
  - To AC power terminal.
- **2 Turns**
  - To AC power terminal.
In addition to the inherent reversing sensor system, this operator has a UL 325 terminal for the connection of external entrapment protection devices installed in each direction of gate travel (minimum of 2 external devices required). Install these devices where the risk of entrapment or a safety hazard exists, examples of which are shown below and the next 2 pages. Installations can vary.

### 4.1 UL 325 Terminal Description

**UL 325 DIP-Switches**

- DIP-switches MUST be turned ON for each device wired to terminal.

**6-Pin UL 325 Terminal**

- Connect ONLY MONITORED Devices

**Sensor LEDs Note:**
- LED ON: Connected device has been activated.
- LED remains off during normal operation.
- LED Flashing: Connected device is in fault. Wiring to device is bad.

**Related Wiring Diagrams**

1. **OPEN Beam Stop:** Obstructed opening-direction photo beam will stop the gate during the opening-direction only. Gate will resume the open cycle when the obstructed photo beam has been cleared.

2. **CLOSE Beam Reverse:** Obstructed closing-direction photo beam will reverse the gate to the open position and reset the close-timer during the closing-direction only. Gate will close when timers time out.

3. **OPEN Edge/Beam Reverse:** Obstructed reversing edge or photo beam will reverse the gate to the close position during the opening-direction only.
   - After the gate reverses to the close position, any opening input will cycle the gate again.
   - Note: If the gate is opening by a time clock and a edge/beam gets obstructed, the gate will return to the closed position and another input (automatic exit loop, reverse loop, remote etc.) is needed to cycle the gate open again.

4. **CLOSE Edge/Beam Reverse:** Obstructed reversing edge or photo beam will reverse the gate to the open position during the closing-direction only.
   - After the gate reverses to the open position, the close-timer will time out and close the gate (if it is turned on).
   - If a second sequential obstruction is encountered prior to the gate reaching the close limit, the gate will reverse to full open position and enter a soft shutdown condition (See page 32).

5 & 6 **Ground (Common):** Common terminals for all the external entrapment protection device inputs.
4.2 Entrapment Protection Device Locations

Typical UL Photo Sensor mounting height and distance away from gate.

Non-Secure Side
Outside Property

Secure Side
Inside Property

Filler Post or Barrier

Reversing Edge (Open Contact Sensor)

Wall

Gate Frame

If the distance between the gate and wall is greater than 2 1/4”.

A filler post or barrier may need to be installed between the gate and wall area to reduce the distance to 2 1/4” or less. A reversing edge should be installed on the post or barrier for safety (See page 2 for more information).

Photo sensors may be installed on either side of gate frame, as close as practical to the gate but no further away than 5”.

No higher than 27.5” above grade.

21” is typical for most installations.

Photo Sensors (With Filler Post and Reverse Edge) Sample Setup

Type of wiring to be used on ALL external devices:
A) Type CL2, CL2P, CL2R, or CL2X.
B) Other cable with equivalent or better electrical, mechanical, and flammability ratings.

UL 325 DIP-Switches

ON

1, 2 and 3

MUST be ON.

6-Pin UL 325 Terminal Wiring

OPEN Beam STOP
CLOSE Beam REVERSE
OPEN Edge/Beam REVERSE
CLOSE Edge/Beam REVERSE
(Common) Ground

Photo Sensor Power Note: Photo sensors can be powered by the built-in convenience outlets located on the operator (See previous page).
Wiring Note: Receiver can be wired directly to main terminal if desired. Power is limited to 250 mA.

Wiring Note: Refer to the instruction sheet that comes with the receiver/transmitter for more specific wiring and mounting instructions.

IMPORTANT: Photo sensors must use Normally Closed (NC) contacts with the beam set for light operate (relay activated when beam is not obstructed). Some manufacturer's photo sensor contacts are labeled as Normally Open (NO) but their relay functions the same way as described above. See specific manufacturer's wiring manual for more information about their specific relay function.

Type of wiring to be used on ALL external devices:
A) Type CL2, CL2P, CL2R, or CL2X.
B) Other cable with equivalent or better electrical, mechanical, and flammability ratings.

UL 325 DIP-Switches

DIP-switches 1, 3 and 4 MUST be ON.

6-Pin UL 325 Terminal Wiring

Only 1 monitored Device can be connected to each input. An OPTIONAL Expansion Kit (sold separately) will allow connection for additional devices.

Wiring Note: Receiver MUST monitor for the presence of the transmitter.

Coax Antenna Kit
P/N 1514-073

24 VAC Receiver
Place receiver in operator.

24 Volt Power is limited to 250 mA

Receiver MUST monitor for the presence of the transmitter.
4.3 Loop Detector Wiring

To help protect the operator from accidentally closing on vehicles in the gate’s path, DoorKing highly recommends that loops and loop detectors be installed. Loops are laid underneath, cut into asphalt or concrete driveways or buried beneath gravel and earth driveways. A loop detection system will sense a vehicle like a metal detector and send a signal to the gate operator preventing the gate from automatically opening or closing on a vehicle when it is in the gate’s path. DoorKing recommends that a licensed installer perform this work.

Reverse Loops
Reverse loops are placed on each side of the gate to prevent the gate from closing on a vehicle in the gate’s path. They will stop or reverse the cycling of the gate while a vehicle is in or near the gate’s pathway.

Automatic Exit Loop
Automatically opens the gate for exiting vehicles without having to use a transmitter or keypad. The exit loop can be placed a minimum of 4 feet away from the reverse loop or far enough away from the gate so the gate has started opening or even completely opened by the time you drive up to it (Free exit).

Note: Loop detector wiring is shown for DoorKing plug-in loop detector (P/N 9410-010 Single Channel). If third party loop detectors are used, refer to the installation instructions supplied with those detectors for wiring and separate power instructions.
SECTION 5 - MAIN TERMINAL WIRING

5.1 Terminal Descriptions

4-Pin Non-Removable Terminal

Notes:
- Use a standard 4-wire 3-button control station. DoorKing’s 3-wire 3-button control station cannot be used.
- When using a 3-button control station and an interlock device together, #3 terminal (N.C.) must be wired in series.
- See next page for wiring.

3-Pin with Jumper

Jumper on bottom 2 pins when using 4-pin terminal.

Jumper on top 2 pins when not using 4-pin terminal.

20-Pin Main Terminal

- If SW 1, switch 3 is ON, functions as a normal full open input (Normal setting).
- If SW 1, switch 3 is OFF, input to terminal #4 becomes the output from the EXIT loop detector plugged into the EXIT loop port. (Used for specialized functions).

This input ONLY functions when gate is fully opened or in the closing cycle.
- When gate is closing: SW 1, switch 5 is OFF, an input to terminal #6 (N.O.) will reverse and open the gate.
- When gate is closing: SW 1, switch 5 is ON, an input to terminal #6 (N.O.) will stop the gate, then continue to close the gate when input is clear (Used to help prevent tailgating vehicles from unauthorized entry). See page 21 for more information.

24-volt DC magnetic lock power is provided constantly except when the gate is opening or open (Normally Closed function). 1 Amp Max.

Operation of relay is dependent on setting of SW 1, switches 7 and 8. Relay contacts can be set for Normally Open (NO) or Normally Closed (NC) operation.
Contact rating is 1 amp maximum at 24-volts DC.

For dual operator applications ONLY. Allows the secondary reversing sensor to monitor the current flow into the secondary operator. See page 24 for more information.

Main Terminal #3 Note:
Exceeding 250 mA of power from this terminal may cause the circuit board transformer to overheat, causing intermittent problems.
5.2 Control Wiring

Fire Dept Open
Gate will ONLY OPEN when this device is activated by authorized personnel ONLY (fire, police, EMS) and operator has power. Alarm will sound during entire open cycle. Operator will then go into a hard shutdown once fully opened. Operator MUST be reset to function normally again. This device MUST be mounted in the line-of-site of gate so authorized personnel can monitor gate movement.

Dual Gate Operators Note: Connect device to BOTH operators, both gates will fully open.

Activation Note: Activation of this device will OPEN gate regardless of the status of the open direction monitored external entrapment protection device(s). If gate is opening, and the operator's inherent entrapment protection system detects an obstruction, the operator will reverse approx. 2 inches and system detects an entrapment protection device(s). If gate is opening, and the operator's inherent entrapment protection system detects an obstruction, the operator will reverse approx. 2 inches and go into a hard shutdown. Operator reset button MUST be pushed to function again.

Operator Cycling
[Diagram showing control wiring]

Terminal #3 Note:
Exceeding 250 mA of power from this terminal may cause the circuit board transformer to overheat, causing intermittent problems.

#4 Access Control Devices

Important: Controls intended for user activation must be located at least six (6) feet away from any moving part of the gate and where the user is prevented from reaching over, under, around or through the gate to operate the controls. Emergency access controls only accessible by authorized personnel (e.g., fire, police, EMS) may be placed at any location in the line-of-sight of the gate.

Type of wiring to be used on ALL external devices:
A) Type CL2, CL2P, CL2R, or CL2X.
B) Other cable with equivalent or better electrical, mechanical, and flammability ratings.

Gate Tracker - DoorKing Access Control System (Model 1833, 1835, 1837 or 1838) tracker system can be connected. This system can keep track of gate operator cycle count, shorted inputs, loop detector problems, any forced entry attempts, if the gate has struck anything during the open or close cycle, power interruptions, etc. For more detailed information refer to the Tracker Installation and Wiring Manual, DoorKing P/N 2358-065. Terminal #2 (Full open) required only if the tracker board will activate the gate operator. Refer to the manual 2358-065 for detailed information.
SECTION 6 - OPERATING INSTRUCTIONS

IMPORTANT SAFETY INSTRUCTIONS

WARNING - To reduce the risk of injury or death:

1. READ AND FOLLOW ALL INSTRUCTIONS.
2. Never let children operate or play with gate controls. Keep the remote control away from children.
3. Always keep people and objects away from gate. NO ONE SHOULD CROSS THE PATH OF THE MOVING GATE.
4. Test the operator monthly. The gate MUST reverse on contact with a rigid object or stop or reverse when an object activates the non-contact sensors. After adjusting the force or the limit of travel, retest the gate operator. Failure to adjust and retest the gate operator properly can increase the risk of injury or death.
5. Use the emergency release only when the gate is not moving and power has been shut-off.
6. KEEP GATES PROPERLY MAINTAINED. Read the owner’s manual. Have a qualified service person make repairs to gate hardware.
7. The entrance is for vehicles only. Pedestrians must use separate entrance.
8. SAVE THESE INSTRUCTIONS.

6.1 Operator Controls and Resets

Unlock the control panel cover to access the controls.

AC Power Switch - Powers the operator ON (toggle up) or OFF (toggle down).

Push to Operate Button - Used to cycle the operator. It will use the auto-close timer when turned ON to close the gate. Opens gate fully.

Reset Button - Used to turn off the entrapment alarm and to reset the operator after a HARD shutdown has occurred.

Alarm Siren

Motor Reset Button - Cover must be removed. Used to reset ONLY the “MOTOR” when weight overload or overheating occurs. Press firmly to reset.
6.2 Shutdown Conditions

Under various entrapment conditions the operator will assume either a soft or hard (alarm) shutdown. To determine what type of reset action is required, you will need to understand how the different entrapment conditions affect the gate operator.

Soft Shutdown (NO Alarm will Sound)

This occurs in various situations where the inherent or external entrapment protection devices have been activated. In a soft shutdown condition, the operator will not respond to any input that was present when the entrapment protection device sensed an obstruction. If the gate stops at the open position, the operator will not respond to the automatic close timer.

- **Example 1** - A time clock keys the gate open in the morning and an entrapment protection device senses an obstruction prior to the gate reaching the full open position. If the entrapment is sensed by the inherent system, the gate will reverse and run back to the closed position. The time clock input is still present, but the gate will not re-open.

Note: In some systems, the time clock input comes from the telephone entry system relay. This same relay may also provide open commands for a card reader, MicroPLUS transmitters and the visitor telephone entry. If so, these devices will also be disabled in a soft shutdown condition.

- **Example 2** - If the gate is closing and an entrapment protection device is activated, the gate will either stop or reverse and run back to the open position, depending upon if the secondary or inherent device was activated. The automatic close timer will not close the gate.

- **Example 3** - Vehicle arrives at exit loop and gate runs towards the open position. If the inherent entrapment protection gets activated during this opening cycle, the gate reverses and runs back to the closed position. After the inherent entrapment protection is cleared, If the vehicle is still present at the exit loop, a soft shutdown condition does not occur. The exit loop input provides an immediate reset of the operator and the gate will again run to the open position.

Resetting a Soft Shutdown

In some conditions, a soft shutdown will reset as soon as the entrapment condition clears. For example, if a non-contact sensor (photocell) is sensing an obstruction, the operator will stop the gate and assume a soft shutdown condition. When the photocell clears, the operator will return to normal operation.

When the operator is in a soft shutdown, activation of any “intended input” will reset the operator. An “intended input” includes any command, any standard safety input and any loop input. Activating any of these inputs will reset the gate. At that point the gate will return to normal operation. If the gate is open, the automatic close timer will then time out and close the gate.

Hard Shutdown (Alarm Activated)

A hard shutdown condition occurs when: (1.) The inherent entrapment protection system (Type A) gets activated TWO consecutive times before the gate completes the open or close cycle. (2.) The reversing edge (Type B2) gets activated and reverses but before the gate completes the reverse cycle the inherent entrapment protection system (Type A) gets activated.

- **Example of a Hard Shutdown** - The gate is closing and the inherent entrapment protection system senses an obstruction and causes the gate to reverse direction. As the gate begins to run in the open direction, a second obstruction is sensed prior to the gate reaching the full open position. Once the second obstruction has been sensed, the operator will stop, the audio alarm will sound and all standard inputs are shut down (including open commands, safety commands, loop inputs, etc.).
  - To silence the alarm, press the reset button or after 5 minutes, the audio alarm will shut off but will “chirp” every 5 seconds. This indicates that the operator is in a hard shutdown condition (The reset button must be pressed to reset the operator and stop the alarm “chirping”).

Resetting a Hard Shutdown

The operator is in a hard shutdown condition when the audio alarm is sounding OR “chirping” every 5 seconds.

- Before resetting a hard shutdown, determine why the shutdown occurred. Inspect the gate for any obstructions along its path that could have activated the inherent entrapment sensing system. Inspect the gate and gate hardware.

The audio alarm will sound for five minutes, or until the operator’s reset button is pushed. After (5) five minutes the alarm will “chirp every 5 sec.” and the hard shutdown condition will remain in affect until the reset button is pushed.

Once the operator has been reset, an open or close command is needed to start the gate operator. Most activating commands will cause the gate operator to cycle to the open position. This includes activation of a key switch or open command and activation of an automatic exit loop. Activation of a close command will run the gate to the closed position.

Note: DoorKing operators have a built-in alarm reset push button mounted on the operator (See previous page for reset button location). Activating this button will return the gate operator to normal operation, but will not cycle the gate operator. A remote alarm/reset station (P/N 1404-080) can be mounted external of the gate operator provided that it is installed in the line-of-sight of the gate and gate operator.
6.3 Manual Gate Operation

Caution: Never attempt to manually operate any gate until you have verified that power to the operator has been shut-off.

1 Pull Manual Release Handle
Pull straight OUT as far as possible and then UP.

2 Release Handle
With handle in UP position, slide back down to lock it in manual release position.

3 Manually Push Gate Open
SECTION 7 - MAINTENANCE AND TROUBLESHOOTING

Inspection and service of this gate operator by a qualified technician should be performed anytime a malfunction is observed or suspected. High cycle usage may require more frequent service checks.

7.1 Maintenance

When servicing the gate operator, always check any external reversing devices (loops, photocells, etc.) for proper operation. If external reversing devices cannot be made operable, do not place this operator in service until the malfunction can be identified and corrected.

Always check the inherent reversing system when performing any maintenance. If the inherent reversing system cannot be made operable, remove this operator from service until the cause of the malfunction is identified and corrected. Keeping this operator in service when the inherent reversing system is malfunctioning creates a hazard for persons which can result in serious injury or death should they become entrapped in the gate.

When servicing this gate operator, always turn power OFF!! If gearbox requires oil, use only Mobil SHC-629 Synthetic Gear Oil. Do not completely fill gearbox with oil. Gearbox should be half full only. Do not exceed this level.

7.2 Built-in Diagnostics

This gate operator is designed with built-in diagnostics that will alert you to potential or existing problems that the microprocessor has detected. Specific fault conditions are checked and the operator will signal that a fault exist through the built-in alarm.

Constant alarm is heard when power is applied: This indicates that the limit switch wire harness is not connected to the circuit board. In this condition, the operator will not run and the tone will continue until the fault is corrected. Check to be sure that the limit switch plugs are properly inserted into P2 and P8.

Constant alarm is heard: This indicates that the operator is in a hard shutdown condition. The alarm will continue to sound for five minutes, and then will “chirp” once every five seconds. The operator-reset button must be pressed or power must be removed and then reapplied to return the operator to normal operation.

Short “alarm chirp” is heard every five seconds: This indicates that the operator has been in a hard shutdown condition in excess of five minutes. This will continue until the operator-reset button is pressed or until power is removed from the operator.

Operator runs for 1 second and stops, two short “alarm chirps” are heard: This indicates that there may be a fault with the primary current sensor circuit. Check that the black current sensor wire has been passed through the hole in the primary current sensor donut on the circuit board with the correct number of loops (1/2 HP motor - 2 loops, 1 HP motor - 1 loop).
7.3 Troubleshooting

Have a good VOM meter with Min/Max test button to check voltages and continuity. A Meg-Ohm meter capable of checking up to 500 meg-ohms of resistance is necessary to properly check the integrity of the ground loops. When a malfunction occurs, isolate the problem to one of three areas: 1) the operator, 2) the loop system, 3) the keying devices. **Use caution when checking high voltage areas: terminals 17 through 20, the motor capacitor and the motor.**

1. Check the input indicator LEDs. They should only come ON when a keying device (card reader, push button, etc.) is activated. If any of the input LEDs are ON continuously, this will cause the gate operator to hold open. Disconnect the keying devices one at a time until the LED goes OFF.

2. Check any external entrapment protection devices. Any short or malfunction in these devices can cause the gate operator to stop or to hold open.

3. A malfunction in a loop or loop detector can cause the gate operator to hold open, or to not detect a vehicle when it is present over the loop. The LEDs next to the loop detector ports on the operator circuit board will light only when the loop has detected an object above it. If the LEDs stays on after the object has gone, then the loop detector has malfunctioned. Pull the loop detector circuit boards from the loop ports on the operator circuit board. If the malfunction persists, the problem is not with the loop system. For more information on troubleshooting loops and loop detectors, refer to your loop detector instruction sheet and to the DoorKing Loop and Loop Detector Information Manual.

4. Check to be sure that there are no shorted or open control wires from the keying devices to the gate operator. If a keying device fails to open the gate, momentarily jumper across terminals 1 and 2 (or 1 and 5) on the gate operator circuit board. If the gate operator starts, this indicates that a problem exist with the keying device and is not with the gate operator.

5. Check the high voltage supply. A voltage drop on the supply line (usually caused by using too small supply voltage wires) will cause the operator to malfunction. Refer to the wire size chart in section 2.1 page 17.

<table>
<thead>
<tr>
<th>Symptom</th>
<th>Possible Solution(s)</th>
</tr>
</thead>
</table>
| Operator will not run. Power LED is OFF. | • Check that power to the operator is turned ON.  
• Transformer may be overheated. Turn power off and allow board to cool for several minutes then retest. Check for low 115 VAC power and low voltage shorts.  
• Check for 115 VAC at terminals 19 and 20. If voltage measures OK, check the terminal strip or replace the circuit board. |
| Operator will not run. Power LED is ON. | • Insure that a minimum of one (1) external entrapment protection device is connected in EACH direction of gate travel (minimum of 2 external devices required) and the inputs are connected and enabled (UL 325 DIP-switches are turned ON).  
• Press motor reset button firmly.  
• Press “Push to Operate” button or momentarily jumper terminal 1 to terminal 2 (or 1 to 5). If the input LED does not come ON, check the terminal strip or replace the circuit board. If LED does come ON, proceed to next steps.  
• **Check Motor:** Gate must be half way open before testing motor.  
  1. **Turn AC power OFF** and remove circuit board. Wire terminal 19 to terminal 18 with a 14 AWG insulated jumper wire. **Turn AC power ON – CAUTION – HIGH VOLTAGE.** The motor should run, turn power **OFF.**  
  2. **With AC power still OFF.** Wire terminal 19 to terminal 17 with a 14 AWG insulated jumper wire. Turn AC power **ON – CAUTION – HIGH VOLTAGE.** The motor should run in the opposite direction as terminal 19 wired to 18, turn power **OFF.**  
  3. If the motor does not run, or runs in only one direction, problem can be a bad motor, motor capacitor, wire connections from the control board to the motor or a bad control board. If the motor runs in both steps above, continue troubleshooting control board and accessories. |
<table>
<thead>

</tr>
</thead>
<tbody>
<tr>
<td>Operator will not run, entrapment protection input(s) LED is ON.</td>
<td>• The entrapment protection device has a fault or the wiring to it is shorted.</td>
</tr>
<tr>
<td>Operator will not run, entrapment protection input(s) LED is Blinking.</td>
<td>• The entrapment protection device is not connected or the wiring to it is open.</td>
</tr>
<tr>
<td>Secondary operator motor will not run.</td>
<td>• Check that SW-1, switch 6 is ON.</td>
</tr>
<tr>
<td></td>
<td>• Press secondary operator motor reset button firmly.</td>
</tr>
<tr>
<td></td>
<td>• Remove circuit board. Momentarily jumper terminal 19 to the primary/secondary interconnection cable terminal 1, then to terminal 2 with a 14 AWG insulated jumper wire. <strong>CAUTION – HIGH VOLTAGE.</strong> The secondary motor should run one way, then the other way as power is applied to each terminal.</td>
</tr>
<tr>
<td></td>
<td>• If the secondary motor runs in both directions, replace the control board. If secondary motor does not run, or runs in only one direction, problem can be in the wiring from the primary to secondary operator, bad secondary motor or motor capacitor.</td>
</tr>
<tr>
<td>Gate will not reverse when an obstruction is encountered.</td>
<td>• Check ERD (Reverse Sensor) setting.</td>
</tr>
<tr>
<td>Gate opens a short distance, then stops and reverses.</td>
<td>• Check the reversing sensitivity.</td>
</tr>
<tr>
<td></td>
<td>• Disconnect the gate from the gate operator and check that the gate slides freely without binding. Gate might be too heavy. Continue troubleshooting.</td>
</tr>
<tr>
<td>Gate opens but will not close.</td>
<td>• Check the input LEDs. Any ON will hold the gate open and indicates a problem with a keying device. Check the secondary safety devices. Any activated will hold the gate open and indicates a problem with the safety device. Check the loop detectors. Any activated can hold the gate open and indicates a problem with the loop detector or ground loop. Operator may be in a “soft shutdown.” Activate any keying device to determine if operator returns to normal operation. If automatic close is desired, be sure SW-1, switch 4 is ON. Check motor as described on previous page.</td>
</tr>
<tr>
<td>Gate closes but will not open.</td>
<td>• Operator may be in a “soft shutdown.” Check input LEDs. If any are ON, momentarily disconnect, then re-connect the wire going to the respective terminal. Operator should open. Check to be sure that the operator is running in the proper direction. Turn power OFF, and then back ON. Activate a keying device. Operator should run in the open direction. If operator runs in the close direction, turn power OFF and change direction switch SW-1, switches 1 and/or 2. Go to above section if operator now opens but will not close. Be sure that the respective LED on the control board lights when the keying device connected to the respective terminal is activated. If LED does not light, momentarily place a jumper wire from terminal 1 to the input terminal being checked. If LED lights and gate opens, problem is with the keying device. If LED does not light, replace control board. Check motor as described on previous page.</td>
</tr>
<tr>
<td>Gate starts to close, then reverses to open.</td>
<td>• Check that the reverse sensitivity is properly adjusted.</td>
</tr>
<tr>
<td></td>
<td>• Disconnect the gate from the operator and check that the gate operates freely without any binding. Check the loop detector LEDs and input LEDs. Any that flash ON will cause the gate to reverse. Check for proper loop wiring. A mis-wired loop detector will cause the gate to reverse. Continue troubleshooting.</td>
</tr>
<tr>
<td>Gate closes and then re-opens</td>
<td>• Check for any input or loop detector LEDs that are ON.</td>
</tr>
<tr>
<td></td>
<td>• Check that the operator is running in the proper direction (see “gate closes but will not open” above).</td>
</tr>
<tr>
<td>Alarm sounds for 5 minutes and then chirps once every 5 seconds.</td>

</table>
7.4 Accessory Items

UL 325 Monitored Entrapment Protection Devices available for the model 9000 slide gate operator.

Type B2 Contact Sensors (Reversing Edge)
- Miller Edge Sensing Edges - all models with a T2 (resistive) termination.
- Miller Edge wireless monitored transmitter/receiver kit model RB-G-K10
- ASO GMBH Sensit GF Series sensing edges

Type B1 Non-contact Sensors (Photo Cell)
- Miller Edge Reflective-Guard Model RG
- Miller Edge Prime-Guard Model PG
- EMX Industries Model IRB-MON
- EMX Industries Model IRB-RET
- Omron Model E3K-R10K4
- Seco-Larm Model E-936-S45RRGQ
- Seco-Larm Model E-960-D90GQ

Monitored Expansion Kit
- Miller Edge Multi-Input Module Model MIM-62

Accessory items available for the model 9000 slide gate operator.

Plug-In Loop Detector - Detectors plug directly into ports on circuit board simplifying wiring.
- Single channel detector - P/N 9410-010
- Dual channel detector - P/N 9409-010
- Single channel detector with aux relay - P/N 9411-010
- Single channel low power draw detector - P/N 9416-010
- Dual channel low power draw detector - P/N 9415-010

External Loop Detector
- Reno A&E 12/24 VDC or 24 VAC - 9402-045
- Carlo Gavazzi 24 VAC/VDC - 9402-044
- Diablo 10-30 VAC/VDC low power draw - 9402-050

Loop Wire - 18 AWG loop wire with XLPE insulation is ideal for ground loops. Available in 500 and 1000 foot rolls. Red, blue or black insulation.

Pre-Fab Loops - Prefabricated ground loops. 24-foot circumference with 50-foot lead-in. Available in yellow, red or blue jackets. Not for use in asphalt roadways.

Loop Test Meter - Meg-ohm meter checks the integrity of ground loops. P/N 9401-045

Interconnection Cable - Interconnect wire cable contains all the necessary wires to interconnect primary / secondary operators.
- Cable length: 30 ft. - P/N 2600-755 40 ft. - P/N 2600-756 50 ft. - P/N 2600-757

Time Clock - 7 day time clock can be used to automatically open gate at pre-set time and days. Compact clock fits inside the operator.
- 7 day clock - P/N 2600-791

High Voltage Kit - Alter the input AC voltage on a 115 VAC 9000 to 208, 230, 460 or 575 VAC. P/N 2600-266

115 VAC Heater with Fan Assembly Kit - Thermostatically controlled heater and fan for cold and hot environments. P/N 1601-154

V-Wheels - 4 inch and 6 inch. UHMW or Steel. Roller bearings or sleeve bearings. Single or tandem wheel configurations.

Endless Idler Assembly with Protective Cover - Use when gate operator chain needs 180° return. P/N 2600-818

Guide Rollers with Protective Covers - A variety of sizes to support slide gates.

Gate End Retainer - Fits on top of end post and helps stabilize the end of the gate in the open or closed position (End post NOT provided).
- P/N 1204-004

Post Mount Kit for 9000 - Required for post mount installation. P/N 9000-015.

Chain Tray Kit - 10 Ft. section. Sections connect together to fit any length gate. P/N 2601-270

Additional #40 Chain - 20 ft. per box. P/N 2600-442

Surge Devices - High and low voltage surge suppressors help prevent circuit board failure caused by lightning strikes and power surges.
- High Voltage - P/N 1879-010
- Low Voltage - P/N 1878-010

Speed Bumps - Prefabricated six-foot speed bump reduces traffic speed through gate system. P/N 1610-150
7.4 Accessory Items Continued

**1000 Inverter/Back-Up Power System** - Power back-up and continuous operation when 115 VAC primary (AC) power has failed. **1000 Watt Model** (P/N 1000-080) can be used to power a single 1/2 HP gate operator system when operating continuously or used with two (2) 1/2 HP gate operator system when opening ONLY ONCE upon a power failure. The “Two battery option” extends the number of times the system can cycle with battery power but does not increase the HP or number of operators that can be used. **1500 Watt Model** (P/N 1000-081) can be used to power two (2) 1/2 HP gate operator system or a single 1 HP gate operator system when operating continuously. **Not available** for the 208/230/460/575 high voltage kit powered operators.

Mounting post kit for 1000 inverter cabinet (P/N 1000-045)

SECTION 8 - OWNER OF THE GATE OPERATOR

8.1 Alarm Sounding and Gate WILL NOT Operate

A KEY has been supplied that will unlock the control panel cover on this gate operator.

Note: The owner of the gate operator is responsible for the KEY availability.

When alarm is sounding . . .

ALWAYS CHECK GATE AREA FOR ANY OBSTRUCTIONS FIRST.

If the cause of the alarm cannot be corrected, shut-off power and DO NOT place this operator back into service until the malfunction can be identified and CORRECTED.

IMPORTANT: Putting this gate operator back into service without CORRECTING the cause of the alarm could result in serious injury or DEATH!

Gate Operator is in a Hard Shutdown Condition when Alarm is Sounding

This occurs when:
1. The inherent entrapment protection system (Type A) gets activated TWO consecutive times before the gate completes the open or close cycle.
2. The reversing edge contact sensor (Type B2) gets activated and reverses but before the gate completes the reverse cycle the inherent entrapment protection system (Type A) gets activated.

The audio alarm will sound for five minutes, or until the operator’s reset button is pushed. After (5) five minutes the alarm will “chirp every 5 sec.” and the hard shutdown condition will remain in affect until the reset button is pushed.

Please read SECTION 6 - OPERATING INSTRUCTIONS for more information about operating this gate operator.
8.2 Manual Gate Operation

**Caution:** NEVER attempt to manually operate the gate until you have VERIFIED that power to the gate operator has been SHUT-OFF!

Please read **SECTION 6 - OPERATING INSTRUCTIONS** for more information about operating this gate operator.

A KEY has been supplied that will unlock the control panel cover on this gate operator.

Note: The owner of the gate operator is responsible for the KEY availability.

Gate CANNOT be manually PUSHED open until MANUAL RELEASE HANDLE has been RELEASED.

1. **Pull Manual Release Handle**
   Pull straight OUT as far as possible and then lift handle UP.

2. **Release Handle**
   With handle in UP position, slide back down to lock it in manual release position.

3. **Manually Push Gate Open**
8.3 Gate Operator’s Monthly Checkup

**Caution:** Make SURE gate area is clear BEFORE testing the gate operator!

**DO NOT** repair or adjust gate systems yourself. Contact a trained gate systems technician with any questions or to make any repairs or adjustments. If you feel uncomfortable performing any of these inspections or testing, a qualified service technician will perform the visual inspections and testing for you.

You can find a trained service technician at DoorKing’s “Dealer Locator” at www.doorking.com

**Visual Inspection**

Visually inspect the rollers, fasteners, brackets and other gate hardware for proper alignment, proper tightness, and signs of damage, breakage, looseness, rust or wear. Moving parts should be lubricated and should not be squeaking. Visually inspect wiring for fraying or exposure. If a malfunction is found, contact a trained service technician to make adjustments or repairs.

**Test Built-In Reversing Sensor**

Begin with the gate in the fully **OPEN** position. Stand just outside the path of the gate and close the gate (typically auto-timer will time-out and close gate automatically). As the gate is **closing**, firmly press a solid object against the end of the gate frame in the direction opposing the travel of the gate. The gate should **stop** within 2 sec. and **reverse** to the **OPEN** position. Another input command is needed before the gate will reset and close again. Repeat this test while **opening** the gate. Start from the fully **CLOSED** position. While **opening**, gate should **stop** and **reverse** to the **CLOSE** position. If gate does **NOT** respond like it should in either direction of gate travel, contact a trained service technician to make adjustments or repairs.

**Test Photo Sensors**

If the gate has a photo sensing device protecting the path of a **closing gate**, perform the following test. Begin with the gate in the fully **OPEN** position. Stand just outside the path of the gate and close the gate (typically auto-timer will time-out and close gate automatically). Pass an object across the path of the closing photo sensing beam. The gate should **stop** within 2 sec. and **reverse** to the **OPEN** position. Typically the auto-timer times out and gate closes again. If the gate has a photo sensing device protecting the path of a **opening gate**, start from the fully **CLOSED** position. OPEN gate. Pass an object across the path of the opening photo sensing beam. The gate should **stop**, the gate will resume opening when the beam is clear. If gate does **NOT** respond like it should in either direction of gate travel, contact a trained service technician to make adjustments or repairs.

**Test Reversing Edges**

If the gate has a reversing edge(s) protecting the path of a **closing gate**, perform the following test. Begin with the gate in the fully **OPEN** position. Stand just outside the path of the gate and close the gate. As the gate is closing, firmly press a solid object against the reversing edge in the direction opposing the travel of the gate. The gate should **stop** within 2 sec. and **reverse** to the **OPEN** position (typically auto-timer will time-out and close gate automatically). If the gate encounters another obstruction before it is closed, the gate will **stop** and reverse to the **OPEN** position **again**. A input command is needed before the gate will reset and close again, auto-timer will **NOT** close gate (Typically, press your remote button for input command). If the gate has a reversing edge(s) protecting the path of a **opening gate**, starting from the fully **CLOSED** position. Stand just outside the path of the gate and open the gate. OPEN gate. As the gate is opening, firmly press a solid object against the reversing edge in the direction opposing the travel of the gate. The gate should **stop** and **reverse** to the **CLOSE** position. If gate does **NOT** respond like it should in either direction of gate travel, contact a trained service technician to make adjustments or repairs.

**Note:** This gate operator uses high levels of force to move the gate and most people underestimate the power of these systems and do not realize the potential hazards associated with this system if **NOT** maintained properly.

Scheduled maintenance visits are offered by most qualified service technicians to MAINTAIN your gate operator system.
SECTION 6 - OPERATING INSTRUCTIONS

Please read for more information about operating this gate operator.

**3 - Manually Push Gate Open**

Alarm will "chirp every 5 sec." and the hard shutdown condition will remain in affect until the reset button is pushed.

**1.** The inherent entrapment protection system (Type A) gets activated TWO consecutive times before the power is turned OFF. This occurs when:

- The inherent entrapment protection system (Type A) gets activated but before the gate completes the reverse cycle the inherent entrapment protection system (Type A) gets activated.

**2.** Release Handle

Gate Operator is in a Hard Shutdown Condition when Alarm is Sounding

**1.** This occurs when:

- Alarm sounds and the gate WILL NOT operate

**2.** Manual Gate Operation

Unlock the control panel cover with a KEY and push reset button.

**3.** Pull Manual Release Handle

Gate cannot be manually pushed open until MANUAL RELEASE HANDLE has been RELEASED.

**Troubleshooting**

**Caution:** NEVER attempt to manually operate the gate until you have VERIFIED that power to the gate operator has been SHUT-OFF!

**Phone #**

**Name**

To obtain key to unlock gate operator contact:

**Manual Gate Operation**

**Alarm Sounding and Gate WILL NOT Operate**

When alarm is sounding...

**Always check gate area for any obstacles FIRST.**
Entrapment Protection must be provided for the gate system where the risk of entrapment or obstruction exists. The operator will NOT run without one or more monitored type B1 or B2 entrapment protection devices in EACH direction of gate travel.
