Entrapment Protection must be provided for the gate system where the risk of entrapment or obstruction exists. The operator will not run without one or more monitored type B1 or B2 entrapment protection devices.

### Additional Descriptions

- **Exit Loop Port Output**
  - Full Open Input: ON
  - Normal Setting. Main terminal 4 is a normal FULL open input.
- **Reverses Gate**
  - Normal Setting. Input to main terminal 10 and reverse loop will reverse gate during close cycle.
- **Quick-Close Timer Override (Slide gates)**
  - Normal Setting. Quick close feature is **OFF**. Auto-Close timer functions normally.
  - Normal Setting. Quick close feature is **ON**. Opening gate will stop and close as soon as all reversing inputs (Reverse loops, photo sensors) are cleared regardless of the distance the gate has opened. Any Auto-Close timer setting overrides to 1 sec.
- **Relay: Main Terminals 13 and 14**
  - 6-OFF 7-OFF | Normal Setting. Relay activates when gate is at open limit. |
  - 6-OFF 7-ON | Relay activates when gate is not closed. |
  - 6-ON 7-OFF | Relay activates when gate is opening and open. |
  - 6-ON 7-ON | Relay activates during opening and closing cycle. |
- **Accessory Power/ Maglock Power**
  - OFF | 500 mA **Constant power** for accessories connected to main terminal 12. |
  - ON | Normally Closed power for Maglock connected to main terminal 12. |

Quick Guide - 1
See page 28 for terminal wiring.

QUICK GUIDE: Terminal Descriptions

UL 325/3 Button 10-Pin Terminal

3 Button Station
- Use a standard 4-wire 3-button control station. DoorKing's 3-wire 3-button control station cannot be used.
- When using a 3-button control station, the 3-pin jumper MUST be set to ON position.

Main Terminal #3 Note:
Exceeding 250 mA of power from this terminal may cause the circuit board transformer to overheat, causing intermittent problems.

- If SW 1, switch 3 is ON, functions as a normal full open input (Normal setting).
- If SW 1, switch 3 is OFF, input to main terminal 4 becomes the output from the EXIT loop detector plugged into the EXIT loop port. (Used for specialized functions).

For long gate applications. An input device connected to main terminal 8 will open the gate to the partial open setting. See page 22 for more information.

This input ONLY functions when gate is fully opened or in the closing cycle.

- When gate is closing: SW 1, switch 4 is OFF, an input to main terminal 10 (eg: photo beam gets obstructed) will reverse and open the gate. Note: If the auto-close timer is ON, when gate reaches the open position, timer will time out and close the gate.
- When gate is closing: SW 1, switch 4 is ON, an input to main terminal 10 (eg: photo beam gets obstructed) will stop the gate, then continue to close the gate when input is clear (Used to help prevent tailgating vehicles from unauthorized entry). See page 21 for more information.

Operation of relay is dependent on setting of SW 1, switches 6 and 7. Relay contacts can be set for Normally Open (NO) or Normally Closed (NC) operation.

Contact rating is 1 amp maximum at 24-volts DC.

Bi-Parting Gates ONLY. Connect secondary gate operator main terminals 16-17-8 to primary main terminal 16-17-8 respectively. 16 & 17 wires MUST be twisted together.

Primary operator is determined by pressing its KEY SWITCH FIRST after powering up operators. This establishes Primary/Secondary operator order.
SPECIFICATIONS FOR MODEL 9024-080

Use this manual for the Model 9024-080 operator with circuit board 4100-010 Rev AA or higher ONLY.

Class of Operation ______________ UL 325 Class I, II, III, IV
Type of Gate ________________ Vehicular Slide Gates Only
Drive Sprocket Size ______________ #40 Chain
Motor ________________ Quadra Drive DC Motor
Power Input: Volts@Amps ________________ 115 VAC @ 1.8 Amps OR 230 VAC @ 0.9 Amps
Batteries ________________ Two 12 Volt, 7.2 A/Hr (Standard)
__________________________ Two 12 Volt, 18 A/Hr (Optional)
Maximum Gate Cycles ________________ AC Power: Continuous
__________________________ Battery Power - 12 Volt, 7.2 A/Hr (Standard): 40 Cycles
__________________________ Battery Power - 12 Volt, 18 A/Hr (Optional): 150 Cycles

Battery Power Note: The number of gate cycles when using ONLY battery power WILL vary depending on gate weight, gate length, operating condition of gate hardware, temperature and amount of charge in batteries.

Gate Speed ________________ 1 Ft/Sec
Max Gate Weight ________________ 1,000 Lbs - 453.6 Kg (Gate installed level in good working condition)
Max Gate Length ________________ 40 Ft - 12.2 Meters (Gate installed level in good working condition)
Inherent Entrapment Protection Device ________________ Inherent Reverse Sensor System (Type A)
External Entrapment Protection Device Inputs ________________ Connection inputs for Non-contact Sensor - Photo Sensor (Type B1)
(Monitored Inputs) ________________ Connection input for Contact Sensor - Reversing Edge (Type B2)

Entrapment Protection must be provided for the gate system where the risk of entrapment or obstruction exists. The operator will not run without one or more monitored type B1 or B2 entrapment protection devices.

OPTIONAL BATTERY
12 Volt 18 Amp/Hr
Battery for Extended Back-Up Power
P/N 1801-004
Two (2) required.

STANDARD BATTERY
12 Volt 7.2 Amp/Hr
Standard Replacement Battery
P/N 1801-003
Two (2) required.

- 8.1 Alarm Sounding and Gate WILL NOT Operate [38]
- 8.2 Manual Gate Operation [39]
- 8.3 Gate Operators Monthly Checkup [40]
- Printable Safety Page [41]
Slide Gate Requirements

The operator is intended for installation only on gates used for vehicles. Pedestrians must be supplied with a separate access opening. The pedestrian access opening shall be designed to promote pedestrian usage. Locate the gate such that persons will not come in contact with the vehicular gate during the entire path of travel of the vehicular gate.

All openings of a horizontal slide gate are guarded or screened from the bottom of the gate to a minimum of six (6) feet (1.83 m) above the ground to prevent a 2 1/4 inch (57.2 mm) diameter sphere from passing through the openings anywhere in the gate and in that portion of the adjacent fence that the gate covers in the open position.

Note: A filler post or barrier may need to be installed in the gap area to reduce the distance to 2 1/4 inches or less. A contact sensor should be installed in this area for safety. (See A on next page and page 25).

DoorKing recommends installing screened wire mesh on the ENTIRE gate AND on that portion of the adjacent fence that the gate covers in the open position. (See above).
Safety Information for Slide Gate Operators

Entrapment protection devices are required to reduce the risk of injury. Install sensors where the risk of entrapment or obstruction exists while gate is moving. **Individual requirements will vary.** See pages 24-26 for more information on typical layout locations and setup.

**Non-Contact Sensors (Photo Sensors)**

1. Minimizes the potential of the gate closing on vehicular or other traffic that loops cannot sense. It can be installed on the secure OR non-secure side of gate.
2. Helps minimize the potential of entrapment during the back travel of the gate.

**Contact Sensor (Reversing Edges)**

1. Installed on the fence to help minimize the potential of entrapment between the gate and fence. A filler post or barrier MAY need to be installed between fence and gate.
2. Helps minimize the potential of entrapment during the back travel of the gate.
3. Minimizes the potential of the gate closing on vehicular or other traffic that loops cannot sense.

**Guide Rollers**

See previous page for more information.

**Automatic Exit Loop**

(Optional) will provide an open command to the gate operator(s) when a vehicle is exiting the property.

**Reverse Loop**

Minimizes the potential of the gate closing when a vehicle is present. Number and placement of loops is dependent on the application.

**Reverse Loop**

Minimizes the potential of the gate closing when a vehicle is present. Number and placement of loops is dependent on the application.

**Warning Sign**

Moving Gate Can Cause Serious Injury or Death

Keep Clear! Gate may move at any time without prior warning.

Do not let children operate the gate or play in the gate area.

This entrance is for vehicles only.

Pedestrians must use separate entrance.

**Physical Stop**

Positive stops shall be required to limit travel to the designed fully open and fully closed positions. These stops shall be installed either at the top of the gate, or at the bottom of the gate where such stops shall horizontally or vertically project no more than is required to perform their intended function.

**Screened Wire Mesh**

May be necessary on part of fence AND entire gate. See previous page for more information.

**Non-Secure Side of Gate**

Physical Stop

See previous page for more information.

**Secure Side of Gate**

Photo Sensor or Reversing Edge is REQUIRED for operator to function.
ASTM F2200 Standard for Gate Construction

Vehicular gates should be constructed and installed in accordance with ASTM F2200; Standard Specification for Automated Vehicular Gate Construction. For a copy of this standard, contact ASTM directly at 610-832-9585; service@astm.org; or www.astm.org.

Important Safety Instructions

WARNING - To reduce the risk of injury or death:
1. READ AND FOLLOW ALL INSTRUCTIONS.
2. Never let children operate or play with gate controls. Keep the remote control away from children.
3. Always keep people and objects away from gate. NO ONE SHOULD CROSS THE PATH OF THE MOVING GATE.
4. Test the operator monthly. The gate MUST reverse on contact with a rigid object or stop or reverse when an object activates the non-contact sensors. After adjusting the force or the limit of travel, retest the gate operator. Failure to adjust and retest the gate operator properly can increase the risk of injury or death.
5. Use the emergency release only when the gate is not moving.
6. KEEP GATES PROPERLY MAINTAINED. Read the owner’s manual. Have a qualified service person make repairs to gate hardware.
7. The entrance is for vehicles only. Pedestrians must use separate entrance.
8. SAVE THESE INSTRUCTIONS!

Instructions regarding intended installation:

• Install the gate operator only if:
  1. The operator is appropriate for the construction of the gate and the usage class of the gate.
  2. All openings of a horizontal slide gate are guarded or screened from the bottom of the gate to a minimum of 6 feet (1.83 m) above the ground to prevent a 2 ¼ inch (57.2 mm) diameter sphere from passing through the openings anywhere in the gate, and in that portion of the adjacent fence that the gate covers in the open position.
  3. All exposed pinch points are eliminated or guarded.
  4. Guarding is supplied for exposed rollers.

• The operator is intended for installation only on gates used for vehicles. Pedestrians must be supplied with a separate access opening. The pedestrian access opening shall be designed to promote pedestrian usage. Locate the gate such that persons will not come in contact with the vehicular gate during the entire path of travel of the vehicular gate.

• The gate must be installed in a location so that enough clearance is supplied between the gate and adjacent structures when open and closing to reduce the risk of entrapment. Swinging gates should not open into public access areas.

• The gate must be properly installed and work freely in both directions prior to the installation of the gate operator. Do not over-tighten the operator clutch, pressure relief valve or reduce reversing sensitivity to compensate for a damaged gate.

• For gate operators utilizing Type D protection:
  1. The gate operator controls must be placed so that the user has full view of the gate area when the gate is moving.
  2. A warning placard shall be placed adjacent to the controls.
  3. An automatic closing device (such as a timer, loop sensor, or similar device) shall not be employed.
  4. No other activation device shall be connected.

• Controls intended for user activation must be located at least six feet (6’) away from any moving part of the gate and where the user is prevented from reaching over, under, around or through the gate to operate the controls. Outdoor or easily accessible controls should have a security feature to prevent unauthorized use.

• The Stop and/or Reset button must be located in the line-of-sight of the gate. Activation of the reset control shall not cause the operator to start.

• A minimum of two (2) WARNING SIGNS shall be installed, one on each side of the gate where easily visible.

• For gate operators utilizing a non-contact sensor:
  1. See the instructions on the placement of non-contact sensors for each type of application.
  2. Care shall be exercised to reduce the risk of nuisance tripping, such as when a vehicle trips the sensor while the gate is still moving in the opening direction.
  3. One or more non-contact sensors shall be located where the risk of entrapment or obstruction exist, such as the perimeter reachable by a moving gate or barrier.

• For gate operators utilizing contact sensors:
  1. One or more contact sensors shall be located where the risk of entrapment or obstruction exist, such as at the leading edge, trailing edge, and post mounted both inside and outside of a vehicular horizontal slide gate.
  2. One or more contact sensors shall be located at the bottom edge of a vehicular vertical lift gate.
  3. One or more contact sensors shall be located at the pinch point of a vehicular vertical pivot gate.
  4. A hardwired contact sensor shall be located and its wiring arranged so that the communication between the sensor and the gate operator is not subjected to mechanical damage.
  5. A wireless contact sensor such as one that transmits radio frequency (RF) signals to the gate operator for entrapment protection functions shall be located where the transmission of the signals are not obstructed or impeded by building structures, natural landscaping or similar obstructions. A wireless contact sensor shall function under the intended end-use conditions.
  6. One or more contact sensors shall be located at the bottom edge of a vertical barrier (arm).

• Be sure you have instructed the owner of the gate operator about safe and proper operation and testing of the gate operator.
Vehicular gate operator products provide convenience and security. However, gate operators must use high levels of force to move gates and most people underestimate the power of these systems and do not realize the potential hazards associated with an incorrectly designed or installed system.

These hazards may include:

- Pinch points
- Entrapment areas
- Reach through hazards
- Absence of entrapment protection devices
- Improperly located access controls
- Absence of vehicle protection devices
- Absence of controlled pedestrian access

In addition to these potential hazards, automated vehicular gate systems must be installed in accordance with the UL 325 Safety Standard and the ASTM F2200 Construction Standard. Most people are unaware of, or are not familiar with, these standards. If an automated vehicular gate system is not properly designed, installed, used and maintained, serious injuries or death can result. Be sure that the installer has instructed you on the proper operation of the gate and gate operator system.

Be sure that the installer has trained you on proper and safe operation of this gate operating system and about the basic functions of the required reversing systems associated with your gate operating system and how to test them (see section 8). These include reversing loops, inherent reversing system, electric edges, photoelectric cells, or other external devices.

- This Owner’s Manual is your property. Keep it in a safe place for future reference.

- Be sure that all access control devices are installed a minimum distance of 6 feet away from the gate and gate operator, or in such a way that a person cannot touch the gate or gate operator while using the device. If access control devices are installed in violation of these restrictions, immediately remove the gate operator from service and contact your installing dealer.
UL 325 Entrapment Protection

Class I - Residential Vehicular Gate Operator
A vehicular gate operator (or system) intended for use in garages or parking areas associated with a residence of one-to four single families.

Class II - Commercial/General Access Vehicular Gate Operator
A vehicular gate operator (or system) intended for use in a commercial location or building such as a multi-family housing unit, hotel, garages, retail store, or other buildings accessible by or servicing the general public.

Class III - Industrial/Limited Access Vehicular Gate Operator
A vehicular gate operator (or system) intended for use in an industrial location or building such as a factory or loading dock area or other locations not accessible by or intended to service the general public.

Class IV - Restricted Access Vehicular Gate Operator
A vehicular gate operator (or system) intended for use in a guarded industrial location or building such as an airport security area or other restricted access locations not servicing the general public, in which unauthorized access is prevented via supervision by security personnel.

Gate Operator Category

Effective January 12, 2016

<table>
<thead>
<tr>
<th>Vertical Lift, Vertical Pivot</th>
<th>Swing, Vertical Barrier (Arm)</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Entrapment Protection Types</strong></td>
<td><em><em>A, B1</em>, B2</em> or D**</td>
</tr>
</tbody>
</table>

- **Type A** - Inherent entrapment protection system.
- **Type B1** - Non-contact sensor (photoelectric sensor or the equivalent).
- **Type B2** - Contact sensor (edge device or equivalent).
- **Type C** - Inherent force limiting, inherent adjustable clutch or inherent pressure relief device.
- **Type D** - Actuating device requiring constant pressure to maintain opening or closing motion of the gate.

* B1 and B2 means of entrapment protection must be MONITORED.

Vertical Barrier Note: Barrier gate operators (arm) that is not intended to move toward a rigid object closer than 16 inches (406 mm) are not required to be provided with a means of entrapment protection.
**Glossary**

**GATE** - A moving barrier such as a swinging, sliding, raising, lowering, or the like, barrier, that is a stand-alone passage barrier or is that portion of a wall or fence system that controls entrance and/or egress by persons or vehicles and completes the perimeter of a defined area.

**RESIDENTIAL VEHICULAR GATE OPERATOR – CLASS I** - A vehicular gate operator (or system) intended for use in a home of one-to four single family dwelling, or garage or parking area associated therewith.

**COMMERCIAL / GENERAL ACCESS VEHICULAR GATE OPERATOR - CLASS II** - A vehicular gate operator (or system) intended for use in a commercial location or building such as a multi-family housing unit (five or more single family units), hotels, garages, retail store, or other building servicing the general public.

**INDUSTRIAL / LIMITED ACCESS VEHICULAR GATE OPERATOR - CLASS III** - A vehicular gate operator (or system) intended for use in an industrial location or building such as a factory or loading dock area or other locations not intended to service the general public.

**RESTRICTED ACCESS VEHICULAR GATE OPERATOR - CLASS IV** - A vehicular gate operator (or system) intended for use in a guarded industrial location or building such as an airport security area or other restricted access locations not servicing the general public, in which unauthorized access is prevented via supervision by security personnel.

**VEHICULAR BARRIER (ARM) OPERATOR (OR SYSTEM)** - An operator (or system) that controls a cantilever type device (or system), consisting of a mechanical arm or barrier that moves in a vertical arc, intended for vehicular traffic flow at entrances or exits to areas such as parking garages, lots or toll areas.

**VEHICULAR HORIZONTAL SLIDE-GATE OPERATOR (OR SYSTEM)** - A vehicular gate operator (or system) that controls a gate which slides in a horizontal direction that is intended for use for vehicular entrance and exit to a drive, parking lot, or the like.

**VEHICULAR SWING-GATE OPERATOR (OR SYSTEM)** - A vehicular gate operator (or system) that controls a gate which moves in an arc in a horizontal plane that is intended for use for vehicular entrance and exit to a drive, parking lot, or the like.

**SYSTEM** - In the context of these requirements, a system refers to a group of interacting devices intended to perform a common function.

**WIRED CONTROL** - A control implemented in a form of fixed physical interconnections between the control, the associated devices, and an operator to perform predetermined functions in response to input signals.

**WIRELESS CONTROL** - A control implemented in means other than fixed physical interconnections (such as radio waves or infrared beams) between the control, the associated devices, and an operator to perform predetermined functions in response to input signals.

**INHERENT ENTRAPMENT PROTECTION SYSTEM** - A system, examples being a motor current or speed sensing system, which provides protection against entrapment upon sensing an object and is incorporated as a permanent and integral part of the operator.

**EXTERNAL ENTRAPMENT PROTECTION DEVICE** - A device, examples being an edge sensor, a photoelectric sensor, or similar entrapment protection device, which provides protection against entrapment when activated and is not incorporated as a permanent part of an operator.

**ENTRAPMENT** - The condition when an object is caught or held in a position that increases the risk of injury.
SECTION 1 - INSTALLATION

Prior to beginning the installation of the slide gate operator, we suggest that you become familiar with the instructions, illustrations, and wiring guide-lines in this manual. This will help insure that your installation is performed in an efficient and professional manner compliant with UL 325 safety and ASTM F2200 construction standards.

The proper installation of the vehicular slide gate operator is an extremely important and integral part of the overall access control system. Check all local building ordinances and building codes prior to installing this operator. Be sure your installation is in compliance with local codes.

1.1 Hardware for the Gate

Good hardware is essential for proper operation of a sliding gate. DoorKing has a full line of gate hardware products that will ensure safe, reliable and long lasting gate operation. The gate must be properly installed and roll smoothly in both directions.

- **Roller Bearing V-Wheels with Protective Cover** - Helps to minimize a pinch point on the gate's wheel and V-rail.
- **Guide Rollers with Protective Covers** - Helps to minimize a pinch point on the gate.
- **Endless Idler Assembly with Protective Cover** - Helps to minimize a pinch point for a 180° chain return.
- **Gate End Retainer** - Helps stabilize the end of the gate in the open or closed position.

1.2 Underground Conduit Requirements

- **Primary Operator Position**
  - 3 Low Voltage Wires (Dual Operator Application Only)
  - External Safety Devices, Controls and P.A.M.S. Wires (Low Voltage wire insulation)
  - Loop Lead-In Wires (Low Voltage wire insulation)
  - AC Input Power (High Voltage wire insulation)
  - Sweeps
  - 3/4 Inch Conduit Recommended

- **Secondary Operator Position**
  - AC Input Power (High Voltage wire insulation)

- The conduit requirements are for a typical slide gate operator installation (the secondary operator is shown for those applications where a secondary operator may be used). **The conduit requirements for your application may vary from this depending on your specific needs.**
- Use only sweeps for conduit bends. Do not use 90° elbows as this will make wire pulls very difficult and can cause damage to wire insulation. DoorKing recommends using 3/4-inch conduit.
- Installation of ONE External Entrapment Protection Device is REQUIRED (photo sensor and/or reversing edge).
- Be sure that all conduits are installed in accordance with local codes.
- **Never** run low voltage rated wire insulation in the same conduit as high voltage rated wire insulation.
1.3 Typical Gate Types

The Model 9024 operator is designed to be installed on any of these gate types. See the next 3 pages for specific operator mounting positions.

- Steel or Aluminum.
- 1,000 lb max. weight per gate.
- Chain tray recommended for gates over 20 ft. (Post mount installation when using a chain tray.)
- Single operator - 40 ft max gate length. Dual operators - 80 ft max gate length.
1.4 Operator Mounting Positions

The Model 9024 operator is designed to be installed in the front, rear and center mounting positions shown on this page and the next 2 pages. V-wheel V-rail ornamental gates are shown as examples but other gate types on the previous page can use the same mounting setups. Once the mounting position has been selected, refer to pages 13 thru 16 for specific installation instructions.

Front Position with Concrete Pad
Standard method of installation.

- Operator’s chain idler wheels are factory set in the top position.

Idler Wheels and Chain Setup

Top View

A filler post or barrier may need to be installed between the gate and wall area (See page 2 for more information).

Front Position with Post Mount Kit
Raises operator and allows different chain heights.

- Set operator chain idler wheels in the bottom position.
- Optional chain tray kit may be installed. See page 16 for more information.

Idler Wheels and Chain Setup

Top View

A filler post or barrier may need to be installed between the gate and wall area (See page 2 for more information).

See page 13 and the post mount instruction sheet included with the kit for more information about post installation.

Additional hardware required. Post mount kit (P/N 9000-015).
Rear Position with Concrete Pad
Hides the chain from outside the property looking in.

- Set one chain Idler wheel at the top and one in the center position.

Top View

A filler post or barrier may need to be installed between the gate and wall area (See page 2 for more information).

Additional hardware required. Endless idler assembly (P/N 2600-818) and additional chain #40 (P/N 2600-442 - 20 ft. per box) may be needed.

Rear Position with Post Mount Kit
Raises operator and allows different chain heights.

- Set one chain Idler wheel at the center and one in the bottom position.

See page 13 and the post mount instruction sheet included with the kit for more information about post installation.

Additional hardware required. Post mount kit (P/N 9000-015). Endless idler assembly (P/N 2600-818) and additional chain #40 (P/N 2600-442 - 20 ft. per box) may be needed.

See page 15 for more information about endless idlers.
**Center Position with Post Mount Kit**  
Hides the chain from outside the property looking in. Allows the use of DoorKing’s chain tray kit to attach to gate. This is useful with long gates. It supports the chain’s weight and helps prevent chain “stretching”.

- Set operator chain idler wheels in the bottom position.

---

**Additional hardware required.** Post mount kit (P/N 9000-015). Endless idler assembly (P/N 2600-818) and additional chain #40 (P/N 2600-442 - 20 ft. per box) may be needed.

---

**Top View**

A filler post or barrier may need to be installed between the gate and wall area (See page 2 for more information).

---

**Gate in Open Position**

See page 15 for more information about endless idlers.

---

**Gate in Close Position**

See page 16 for more information.

---

**DoorKing’s Chain Tray Kit for Long Gates**

See page 16 for more information.
**Concrete Pad Setup**

**Concrete Pad Setup**

- Minimum Concrete Pad: 24" x 24" x 16.5"
- Extended Concrete Porch (Work Area): 24" x 12" x 7"
- **Concrete Pad MUST be level.**

**Optional Post Mount Kit**

DoorKing offers a post mount kit specifically for the Model 9024 (P/N 9000-015). The kit includes a base plate, 2 posts and hardware to attach the operator to the base plate. This kit will raise the operator and allow different chain heights for specific operator applications. Refer to the instruction sheet provided with the kit for concrete foundation size, conduit type and placement. This kit is needed if a chain tray is required to support the chain's weight when a longer gate is used (See page 16 for more information about DoorKing's chain tray kit).

- Underground depth of the concrete foundation is determined by soil conditions and local building codes, 18" minimum depth. Reinforced concrete recommended.
- 3/4" conduit with sweeps.
1.6 Positioning Operator and Chain

- Operator and chain **MUST** be parallel to gate!
- Chain bracket **MUST** line up with chain idler wheels!
- Chain brackets **MUST** be mounted so the chain remains the same height as it is on the idler wheels!

1.7 Attaching Operator and Chain

**Attaching Operator to Concrete Pad**
DoorKing recommends a minimum of four (4) 3/8" x 2" sleeve anchors (not supplied).

**Attaching Operator to Post Mount Plate**
Use bolts provided in post mount kit.

**Connect Chain Bracket to Gate.** Weld completely around bracket. Chain nut and chain bolt should not protrude past gate frame.

**Connect Chain to Chain Bracket.** Connect chain to chain bolt with master link. Adjust the chain nuts to tighten the chain. The chain should sag no more than one (1) inch per 10 feet of travel. **Do not over tighten the chain.**
1.8 Endless Idler Assembly (On Select Installations)

DoorKing offers an endless idler assembly with a protective cover designed for the Model 9024 installations (P/N 2600-818). Make sure the endless idler assembly is securely fastened to the wall or post (Depending on which type of installation will be used). Extreme force will be exerted on this assembly during gate cycling.

Lower chain does NOT align with upper chain.

Lower chain MUST align with upper chain!

Note: Be sure that the chain is aligned and parallel to the gate. Installing the chain in any other manner will cause excessive noise, chain idler wheel wear and chain stretching.

Lower chain MUST be 1 inch lower than the endless idler's 180° chain return.

Upper and lower chain MUST be the same height as they are on the operator idler wheels.
1.10 Installation of Warning Signs

This DoorKing Slide Gate Operator is shipped with two warning signs. The purpose of the warning sign is to alert uninformed persons, and to remind persons familiar with the gate system, that a possible hazard exists so that appropriate action can be taken to avoid the hazard or to reduce exposure to the hazard. See page 3 for suggested mounting positions of signs.

- **Permanently install the supplied warning signs in locations so that the signs are visible by persons on both sides of the gate.**
- **Use appropriate hardware such as wood or sheet metal screws (not supplied) to install the warning signs.**

---

1.9 DoorKing’s Chain Tray Kit

A chain tray is recommended for gates longer than 20 ft. to support the weight of the chain. DoorKing offers a chain tray kit in 10 ft. sections to fit any length gate. (DoorKing P/N 2601-270 10 Ft. section)

The Chain tray supporting brackets can be mounted facing up (as shown) or facing down depending on the operator height.

For further information about the chain tray installation, refer to instructions provided with the chain tray kit.
Before attempting to connect any wiring to the operator, be sure that the circuit breaker in the electrical panel is in the OFF position. Permanent wiring must be installed to the operator as required by local electrical codes. It is recommended that a licensed electrical contractor perform this work.

Since building codes vary from city to city, we highly recommend that you check with your local building department prior to installing any permanent wiring to be sure that all wiring to the operator (both high and low voltage) complies with local code requirements.

**THIS GATE OPERATOR MUST BE PROPERLY GROUNDED!!**

### 2.1 AC Power Wire Runs and Terminal Connection

If power wiring is greater than the maximum distance shown, it is recommended that a service feeder be installed. When large gauge wire is used, a separate junction box must be installed for the operator connection. The wire table is based on stranded copper wire. Wire run calculations are based on an AC power source with a 3% voltage drop on the power line, plus an additional 10% reduction in distance to allow for other losses in the system.

This table illustrates the high voltage AC power wire size and distance limitations.

<table>
<thead>
<tr>
<th>Wire Size / Max Distance in Feet</th>
<th>Amps</th>
<th>12 AWG</th>
<th>10 AWG</th>
<th>8 AWG</th>
<th>6 AWG</th>
</tr>
</thead>
<tbody>
<tr>
<td>115 VAC Single Phase Input Power</td>
<td>1.8</td>
<td>550</td>
<td>850</td>
<td>1450</td>
<td>2100</td>
</tr>
<tr>
<td>230 VAC Single Phase Input Power</td>
<td>0.9</td>
<td>2000</td>
<td>3500</td>
<td>5900</td>
<td>8900</td>
</tr>
</tbody>
</table>

**Optional** Heater Installation Note: When installing a heater, refer to the “high voltage AC power wire size and distance limitations” table on the instruction sheet with the heater kit for AC power wire run limitations.

**CAUTION**

High Voltage AC input power MUST MATCH the operator selector switch or DAMAGE will occur and VOID the warranty!

**DANGER**

High Voltage! Do not power up the operator until “Section 2.2” is complete (see next page).

**Do not** wire solar power when using AC power.

---

**115 VAC Connection**

- **Green - Chassis Ground**
- **High Voltage Conduit**
- **115 VAC Input Power Wire**
- **External Power Disconnect Switch**

**External Power Disconnect Switch**

**Single-Phase 230 VAC Input Power Wire**

---

**115 VAC Convenience Outlets Can Power Accessories**

- Route incoming AC power wire through the high voltage conduit and run wire to the operator electronic box.
- Be sure wiring is installed in accordance with local codes. Be sure to color code all wiring.
- It is recommended that a surge suppressor be installed on the high voltage power lines to help protect the operator and circuit board from surges and power fluctuations.
- Secondary operator MUST have its own input power wire when installing dual gate operators (See next page).

---

**EXTERIAL ENTRAPMENT PROTECTION DEVICES MUST be connected or the gate operator WILL NOT function.**
2.2 Setting Input Power Jumper and Turning Power ON

The “POWER SEL” jumper on the circuit board MUST be set correctly or the operator will not function correctly. DO NOT cycle the operator until the “DIP-Switches” and the “Limit Switches” have been adjusted. Damage could occur to the gate and gate operator. See pages 20-22.

Important: Pins 1 and 2 MUST be jumpered together when using AC input power. DO NOT jumper pins 2 and 3 together or circuit board will shut off power after 5 minutes of idle time.

Important Battery Plug Note: Battery Plug P2 comes from the factory unplugged and needs to be plugged into circuit board when operator is ready to be powered up.

2.3 Input Power for Dual Gate Operators

• Each operator MUST be supplied with it’s own input power wire.
• All control, loop detector, safety and auxiliary devices MUST be wired to the primary operator. See pages 24-27 and 29 for wiring information.
• Primary operator is determined by pressing its KEY SWITCH FIRST after powering up operators. This establishes Primary/Secondary operator order.

To power up operator: turn both AC and DC power switches ON. LEDs will light up on circuit board.

Using DC Power ONLY Note: If powering up operator using ONLY DC power, the KEY SWITCH must be pressed AFTER DC power switch is turned ON to power up operator.
SECTION 3 - ADJUSTMENTS

The switch settings and adjustments in this chapter should be made after your installation and wiring to the operator(s) is complete. Whenever any of the programming DIP-switches on the circuit board are changed, ALL power must be shut-off, and then turned back on OR press reset button for the new setting to take effect.

3.1 4100 Circuit Board Descriptions and Adjustments

How LEDs Function
Illuminated LEDs indicates that low voltage power is being applied to the circuit board.

- Input LEDs should be OFF and will only illuminate when the input that is next to the LED is activated. See page 28.
- Limit LEDs will only illuminate when the respective limit switch has been activated.
- Loop LEDs will only illuminate when a reverse or exit loop is activated (Vehicle passing over a loop).

Self-Test
Self-test mode is for bench checks ONLY! Operator MUST be disconnected from the gate.

- The jumper must be set at normal mode for normal operator function.

Limit/Alarm Plug P3 Terminal
10-Pin UL 325/3 Button Station Removable Terminal See pages 24-26.

3 Button Station Jumper See page 29.

Reverse Sensor
Adjust reversing sensitivity for the open AND close direction of the operator. See page 23.

Auto-Close Timer
Auto-close timer (when turned on) SW 1, switch 2.

Time Delay:
Adjust from 1 second (full counter-clockwise) to approximately 23 seconds (full clockwise).

Key Switch: Cycles the operator when pressed. Will use Auto-Close timer when turned ON.

- Note: If powering up operator using ONLY DC power, the key switch MUST be pressed AFTER DC power switch is turned ON to power up operator.

Bi-Parting Gates Note: MUST be pressed on PRIMARY operator FIRST after powering up operators to establish PRIMARY/Secondary operator order.

DIP-Switches
Set the DIP-switches on the circuit board to the desired setting. See switch-settings on next 2 pages.

Reset Button: Press after changing a DIP-switch setting on the board or if board locks up during operation.

Board Relay
Dry relay contacts (terminals 13-14) can be set for Normally Open (NO) or Normally Closed (NC) operation by placing the relay shorting bar on the N.O. or N.C. pins respectively. SW 1, switches 6 and 7 must be set to control relay. See next page for descriptions.
### 3.2 DIP-Switch Settings for 4100 Circuit Board

The two DIP-switches located on the circuit board are used to program the operator to operate in various modes and to turn on or off various operating features. Whenever a switch setting is changed, reset button must be pressed for the new setting to take affect. See next page for more information about DIP-switches.

<td>OFF</td>
</tr>
</tbody>
</table>

**Switch 1 - Operator Opening Direction:** Must OPEN the operator’s gate upon initial AC power up and open command. If the first open command begins to close the gate, turn AC power off and reverse this switch.

**Switch 2 - Auto-Close Timer:** Turns the auto-close timer on or off. If auto-close is ON, maximum time that can be set is approximately 23 secs.

If auto-close is OFF, an open gate will not close until a manual input is received.

**Switch 3 - EXIT Loop Port Output / Full Open Input:** Determines that a device wired to main terminal 4 is a normal full open command (ON) OR terminal 4 becomes the output from the exit loop detector that is plugged into the EXIT Loop port in the circuit board (OFF) (Used for specialized functions).

**Switch 4 - Reverse / Stop Gate:** Determines if an input to main terminal 10 (Photo Sensors) AND/OR reverse loops will reverse OR stop a CLOSING gate.

A tailgating vehicle can activate main terminal 10 (Photo sensors) and/or reverse loops while the gate is in the closing cycle from the previous vehicle’s authorized entry:

- If switch 4 is turned OFF (Reverse), the closing gate that gets activated by a tailgating vehicle will reverse back to the open position, possibly allowing the tailgating vehicle unauthorized entry while the gate is reversing back to the open position.
- If switch 4 is turned ON (Stop), the closing slide gate that gets activated by a tailgating vehicle will stop, partially or completely blocking the pathway, NOT allowing the tailgating vehicle to enter without proper authorization. The slide gate will not move until all sensors are clear, usually forcing the tailgating vehicle that activated the sensors to back away from the gate. The slide gate will then continue until closed, helping prevent the tailgating vehicle from unauthorized entry.

**Switch 5 - Quick-Close Timer Override:** Turning the quick-close feature ON will cause an opening gate to stop and close when the reverse loops and/or photo sensors have been cleared by a vehicle no matter how far the gate has opened (Useful when opening a long gate to reduce gate cycling time). This will also override the auto-close timer setting to close the gate after 1 second, regardless of the time that has been set for the auto-close timer.

**Switches 6-7 - Relay:** These work in conjunction with each other and determine when the relay on the board (main terminals 13-14) will be activated. This relay can be used as a switch for various functions such as illuminating a warning light when the gate is moving, or turning on a green light when the gate is full open.

**Switch 8 - Accessory Power / Maglock Power:** A maximum of 500 mA of constant power is supplied to any accessory connected to main terminals 11 and 12 when this switch is OFF.

Turn this switch ON ONLY if a magnetic lock is connected to main terminals 11 and 12. This applies magnetic lock power and logic to these terminals which is a Normally Closed function: Power is shut off .5 sec. prior to gate starting and remains off while gate is opening and in the open position. Power is turned on after gate is closed again.

### SW-2 Switch
(Bottom 8 switches on circuit board)

<table>
<thead>

</tr>
<tr>
<td>MUST use - OFF</td>
<td>12345678</td>
</tr>
</tbody>
</table>

**Switches 1-2 - Select Operator Type:** Sets the type operator that will be used with the circuit board.

**Switch 3 - Input Power Failure Mode:** When this switch is turned OFF and a AC input power failure occurs, gate will continue to operate normally using ONLY battery back-up power. When battery back-up power has been depleted, gate will remain CLOSED and operator will shut down. After AC input power has been restored, gate will return to normal operation.

When this switch is turned ON, gate will automatically fully open and operator will shut down during an AC input power failure. After AC input power has been restored, gate will close.

**Switch 4 - Reverse Input:** This switch MUST be turned OFF for the 9024. Main terminal 10 is a reverse input. DO NOT turn ON.

**Switch 5 - Overlapping Dual Gates:** This switch MUST be turned OFF for the 9024. The dual gate operators will start the open and close cycles at the same time. DO NOT turn ON.

**Switch 6 - Circuit Board Power Management:** Turn OFF when using 115/230V input power to allow circuit board to have constant power. DO NOT turn ON.

*Note:* ONLY turn this switch ON when using solar power. It minimizes the power drain by the circuit board. When the gate has been closed for 5 min. or held open for 5 min., circuit board will power down. Main terminals 1, 2, 3 and loop detector ports will remain powered up. An input from one of these connections will power up the circuit board again. NOT used for AC input power.

**Switches 7-8 - Not Used:** These switches MUST be turned OFF for the Model 9024. DO NOT turn ON.
3.3 Limit Switches

Full Open and Close Limits MUST be Set

The operator normally stops a cycling gate using the open and close limits. If the limits have not been set, the gate could continue beyond its full open and close positions, damaging the gate and operator. DO NOT allow this to occur!

Partial Open Feature

This feature allows long gates to partially open when a fully open gate is not required for normal use. The FULL open limit switch MUST first be set before adjusting the partial open gate position. When the operator’s inherent reversing sensor gets activated during the gate’s closing cycle, it will always reverse the gate to the FULL OPEN limit switch setting, even when the partial open feature is being used. When using the “Partial Open” feature, the operator’s opening device MUST be connected to the main terminal #8.

See page 29 for opening device wiring information.

Loosen adjustment nut to position the partial open assembly to stop the opening gate at a desired “Partial Open” position.

Note: Limit/Alarm Plug P3 MUST be connected to the circuit board or operator will NOT function.
3.4 Inherent Reverse Sensor Adjustment

This vehicular gate operator is equipped with an inherent adjustable reversing sensor (Type A) used as entrapment protection system according to UL 325 standards. The gate will reverse direction after “physically” encountering an obstruction in either the opening or closing gate cycle.

If the Auto-Close Timer (DIP-switch SW 1, switch 2) is ON and the gate physically encounters an obstruction during the CLOSING cycle, it will reverse to the open position and HOLD the gate at this position (Soft shutdown condition). Another input command is needed before the gate will reset and close again (open device command, safety device command, exit loop input).

If the Partial Open Feature is being used and the gate physically encounters an obstruction during the CLOSING cycle, the gate will reverse to the FULL open limit switch setting and NOT the partial open setting.

For the reverse system to function correctly, the gate must be properly installed and work freely in both directions and the limit switches must be properly adjusted before adjusting these sensors. The ideal adjustment will allow the operator to move the gate through its entire travel cycle without reversing, but will reverse upon contact with an obstruction with no more than 40 Lbs of force. This force can be measured with a gate scale.

**CAUTION:** Keep pedestrians and vehicles clear of the gate while adjusting and testing sensors!

1. Press the “Push to Operate” button to OPEN the gate.

2. While gate is opening, slowly rotate the reverse sensor clockwise until the LED lights up and the gate reverses direction. Rotate the reverse sensor back counter-clockwise approximately 1/8 turn to decrease the sensitivity (LED will turn off).

3. Press the “Push to Operate” button and CLOSE the gate. Make sure the gate closes completely. If it reverses and opens (LED will turn on), rotate the reverse sensor counter-clockwise a little more to decrease the reverse sensitivity (LED will turn off). Cycle the gate a few times to be sure that it cycles completely in both directions, adjusting the sensor as necessary.

**Dual Operators:**

Each gate operator’s reverse sensor will have to be adjusted when dual operators have been installed.

**Test the operator reversing sensitivity:**

Place an immobile object along the gate path, allowing the gate to strike it while in the open and close cycles. The gate must reverse direction after striking the object. If it does not, increase the reverse sensitivity and repeat this testing until the correct sensitivity has been achieved in BOTH directions. The operator will assume a soft shutdown (Hold the auto-close timer) after striking and reversing the gate which will require pressing the “Push to Operate” button to cycle the operator again.
**SECTION 4 - ENTRAPMENT AND SAFETY PROTECTION**

External Entrapment Protection Devices:
In addition to the inherent reversing sensor system, this operator has a UL 325 terminal for the connection of **photo sensors**-Type B1 and/or **reversing edges**-Type B2 entrapment protection required by UL 325 standards. **Entrapment Protection must be provided for the gate system where the risk of entrapment or obstruction exists. The operator will not run without one or more monitored type B1 or B2 entrapment protection devices.** Install these devices where the risk of entrapment or a safety hazard exists, examples of which are shown below and the next 2 pages. Specific installations will vary.

### 4.1 UL 325 Terminal Description

**UL 325 Terminal**

Connect **ONLY MONITORED Devices**

<table>
<thead>

<td>Photo Sensors POWER: Terminal 12 supplies 24 VDC, 500 mA of constant power for desired <strong>accessories</strong> when a maglock is <strong>NOT</strong> used.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Primary operator is determined by pressing its KEY SWITCH FIRST after powering up operators. This establishes Primary/Secondary operator order.**

- **OPEN Beam Stop:** Obstructed opening-direction photo beam will stop the gate during the opening-direction only. Gate will resume the open cycle when the obstructed photo beam has been cleared.

- **CLOSE Beam Reverse:** Obstructed closing-direction photo beam will reverse the gate to the close position and reset the close-timer during the closing-direction only. Gate will close when timer times out.

- **OPEN Edge/Beam Reverse:** Obstructed reversing edge or photo beam will reverse the gate to the close position during the opening-direction only.

  - After the gate reverses to the close position, any opening input will cycle the gate again. Note: If the gate is opening by a time clock and a edge/beam gets obstructed, the gate will return to the closed position and another input (automatic exit loop, reverse loop, remote etc.) is needed to cycle the gate open again.

- **CLOSE Edge/Beam Reverse:** Obstructed reversing edge or photo beam will reverse the gate to the open position during the closing-direction only.

  - After the gate reverses to the open position, the close-timer will time out and close the gate (if it is turned on).
  - If a second sequential obstruction is encountered prior to the gate reaching the close limit, the gate will reverse to full open position and enter a soft shutdown condition (See page 31).

5 & 6 **Ground (Common):** Common terminals for all the external entrapment protection device inputs.
4.2 External Entrapment Protection Device Locations

**Typical UL Photo Sensor mounting height and distance away from gate.**

<table>
<thead>
<tr>
<th>Non-Secure Side</th>
<th>Secure Side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Outside Property</td>
<td>Inside Property</td>
</tr>
</tbody>
</table>

**Non-Secure Side**
- Outside Property
- Note: Additional photo sensors can be added above the 27.5” height.
- No higher than 27.5” above grade.
- 21” is typical for most installations.

**Secure Side**
- Inside Property
- UL sensor mounted on post.

Photo sensors may be installed on either side of gate frame, as close as practical to the gate but no further away than 5”.

**If the distance between the gate and wall is greater than 2 1/4”**.

A filler post or barrier may need to be installed between the gate and wall area to reduce the distance to 2 1/4” or less. A reversing edge should be installed on the post or barrier for safety (See page 2 for more information).

**Photo Sensors (With Filler Post and Reverse Edge) Sample Setup**

**UL 325 Terminal Wiring**

Connect ONLY MONITORED devices to UL 325 terminal.

Only 1 monitored Device can be connected to each input. An OPTIONAL Expansion Kit (sold separately) will allow connection for additional devices.

**Photo Sensor Power Note:** Photo sensor power can be provided by circuit board (See previous page).
IMPORTANT: Photo sensors must use Normally Closed (NC) contacts with the beam set for light operate (relay activated when beam is not obstructed). Some manufacturer's photo sensor contacts are labeled as Normally Open (NO) but their relay functions the same way as described above. See specific manufacturer's wiring manual for more information about their specific relay function.

IMPORTANT: Photo sensors must use Normally Closed (NC) contacts with the beam set for light operate (relay activated when beam is not obstructed). Some manufacturer's photo sensor contacts are labeled as Normally Open (NO) but their relay functions the same way as described above. See specific manufacturer's wiring manual for more information about their specific relay function.

IMPORTANT: Photo sensors must use Normally Closed (NC) contacts with the beam set for light operate (relay activated when beam is not obstructed). Some manufacturer's photo sensor contacts are labeled as Normally Open (NO) but their relay functions the same way as described above. See specific manufacturer's wiring manual for more information about their specific relay function.

IMPORTANT: Photo sensors must use Normally Closed (NC) contacts with the beam set for light operate (relay activated when beam is not obstructed). Some manufacturer's photo sensor contacts are labeled as Normally Open (NO) but their relay functions the same way as described above. See specific manufacturer's wiring manual for more information about their specific relay function.

Wireless Note: Refer to the instruction sheet that comes with the receiver/transmitter for more specific wiring and mounting instructions.

Wiring Note: Receiver can be wired directly to main terminal if desired. Power is limited to 250 mamps.

Main Terminal #3 Note: Exceeding 250 mA of power from this terminal may cause the circuit board transformer to overheat, causing intermittent problems.
4.3 Loop Detector Wiring

To help protect the operator from accidentally closing on vehicles in the gate’s path, DoorKing highly recommends that loops and loop detectors be installed. Loops are laid underneath, cut into asphalt or concrete driveways or buried beneath gravel and earth driveways. A loop detection system will sense a vehicle like a metal detector and send a signal to the gate operator preventing the gate from automatically opening or closing on a vehicle when it is in the gate’s path. DoorKing recommends that a licensed installer perform this work.

Reverse Loops
Reverse loops are placed on each side of the gate to prevent the gate from closing on a vehicle in the gate’s path. They will stop or reverse the cycling of the gate while a vehicle is in or near the gate’s pathway.

Automatic Exit Loop
Automatically opens the gate for exiting vehicles without having to use a transmitter or keypad. The exit loop can be placed a minimum of 4 feet away from the reverse loop or far enough away from the gate so the gate has started opening or even completely opened by the time you drive up to it (Free exit).

DoorKing offers a free “Loop and Loop-Detectors Information Manual” PDF located at DoorKing’s web site for more information. www.doorking.com

Exit loop lead-in wires are twisted approx. 6 twists per foot.

Note: SW 1, switch 4 must be set for the reverse loops. See pages 20 and 21 for more information about SW 1, switch 4 ON/OFF options.

4.3 Loop Detector Wiring

<table>

Note: Loop detector wiring is shown for DoorKing plug-in loop detector (P/N 9410-010 Single Channel). If third party loop detectors are used, refer to the installation instructions supplied with those detectors for wiring and separate power instructions.

DoorKing Plug-in Loop Detectors

Single Channel Loop

Exit Loop Port

Reverse Loop Port

Primary operator is determined by pressing its KEY SWITCH FIRST after powering up operators. This establishes Primary/Secondary operator order.

Loop detectors are wired to the PRIMARY operator when using dual gate operators.
 SECTION 5 - MAIN TERMINAL WIRING

5.1 Terminal Descriptions

3 Button Station
- Use a standard 4-wire 3-button control station. DoorKing’s 3-wire 3-button control station cannot be used.
- When using a 3-button control station, the 3-pin jumper MUST be set to ON position.
- See next page for wiring.

Main Terminal #3 Note:
Exceeding 250 mA of power from this terminal may cause the circuit board transformer to overheat, causing intermittent problems.

UL 325
See pages 24 - 26

Connects to a DoorKing Tracker Expansion Board. Data will be reported about this gate operator’s SPECIFIC activity to a DoorKing access control system. A list of the events will be “Tracked” and stored in the access control system.

Tracker Data
Tracker In

If SW 1, switch 3 is ON, functions as a normal full open input (Normal setting).

If SW 1, switch 3 is OFF, input to main terminal 4 becomes the output from the EXIT loop detector plugged into the EXIT loop port. (Used for specialized functions).

For long gate applications. An input device connected to main terminal 8 will open the gate to the partial open setting. See page 22 for more information.

This input ONLY functions when gate is fully opened or in the closing cycle.

When gate is closing: SW 1, switch 4 is OFF, an input to main terminal 10 (eg: photo beam gets obstructed) will reverse and open the gate. 
Note: If the auto-close timer is ON, when gate reaches the open position, timer will time out and close the gate.

When gate is closing: SW 1, switch 4 is ON, an input to main terminal 10 (eg: photo beam gets obstructed) will stop the gate, then continue to close the gate when input is clear (Used to help prevent tailgating vehicles from unauthorized entry). See page 21 for more information.

SW1, switch 8 OFF: 24-VDC, 500 mA constant power can be provided for desired accessories wired to main terminal 12 when the maglock is NOT used.

SW1, switch 8 ON: 24-VDC Maglock power is provided except when the gate is opening or open (Normally Closed function). 1 Amp Max.

Operation of relay is dependent on setting of SW 1, switches 6 and 7.
Relay contacts can be set for Normally Open (NO) or Normally Closed (NC) operation.
Contact rating is 1 amp maximum at 24-volts DC.

Bi-Parting Gates ONLY. Connect secondary gate operator main terminals 16-17-18 to primary main terminal 16-17-18 respectively. 16 & 17 wires MUST be twisted together.

Primary operator is determined by pressing its KEY SWITCH FIRST after powering up operators. This establishes Primary/Secondary operator order.
5.2 Control Wiring

UL 325/3 Button 10-Pin Terminal

3-Button Control Station
Use a standard 4-wire 3-button control station. DoorKing’s 3-wire 3-button control station cannot be used.

Important: Controls intended for user activation must be located at least six (6) feet away from any moving part of the gate and where the user is prevented from reaching over, under, around or through the gate to operate the controls. Emergency access controls only accessible by authorized personnel (e.g., fire, police, EMS) may be placed at any location in the line-of-sight of the gate.

Gate Tracker - DoorKing Access Control Systems (Models 1833, 1835, 1837 or 1838) tracker system can be connected. This system can keep track of gate operator cycle count, shorted inputs, loop detector problems, any forced entry attempts, if the gate has struck anything during the open or close cycle, power interruptions, etc. For more detailed information refer to the Tracker Expansion Board Hardwired Installation/Owner’s Manual, DoorKing P/N 2358-065.

Terminal #6 (Full open) or #8 (Partial open) required only if the tracker board will activate the gate operator. Refer to the manual 2358-065 for detailed information.

Main Terminal #3 Note: Exceeding 250 mA of power from this terminal may cause the circuit board transformer to overheat, causing intermittent problems.

3-Pin With Jumper
MUST be ON when using 3-button terminals.

#8 Terminal Note: Any opening device connected to terminal #8 will open the gate to the partial open setting. External entrapment protection devices will also open the gate to the partial open setting. If the inherent reverse sensor gets activated during the close cycle, it will always fully open the gate.

20-Pin Main Terminal

Secondary Operator
Bi-Parting Gates
Primary operator is determined by pressing its KEY SWITCH FIRST after powering up operators. This establishes Primary/Secondary operator order.

#12 Terminal Note: 24 VDC, 500 mA accessories can be powered by this terminal if maglock is NOT used. SW1, switch 8 MUST be OFF.
SECTION 6 - OPERATING INSTRUCTIONS

IMPORTANT SAFETY INSTRUCTIONS

WARNING - To reduce the risk of injury or death:

1. READ AND FOLLOW ALL INSTRUCTIONS.
2. Never let children operate or play with gate controls. Keep the remote control away from children.
3. Always keep people and objects away from gate. NO ONE SHOULD CROSS THE PATH OF THE MOVING GATE.
4. Test the operator monthly. The gate MUST reverse on contact with a rigid object or stop or reverse when an object activates the non-contact sensors. After adjusting the force or the limit of travel, retest the gate operator. Failure to adjust and retest the gate operator properly can increase the risk of injury or death.
5. Use the emergency release only when the gate is not moving and power has been shut-off.
6. KEEP GATES PROPERLY MAINTAINED. Read the owner’s manual. Have a qualified service person make repairs to gate hardware.
7. The entrance is for vehicles only. Pedestrians must use separate entrance.
8. SAVE THESE INSTRUCTIONS.

6.1 Operator Controls

- AC Power Switch - Powers the AC ON (toggle up) or OFF (toggle down).
- DC Power Switch - Powers the DC ON (toggle left) or OFF (toggle right).
- Note: If powering up operator using ONLY DC power, the key switch MUST be pressed (located on circuit board) AFTER DC power switch is turned ON to power up operator.
- Push to Operate Button - Push to cycle the operator. It will use the auto-close timer when turned ON to close the gate. Opens gate fully.
- Alarm Reset Button - Push to turn off the entrapment alarm after a HARD shutdown has occurred.
- Alarm Siren

Unlock the control panel cover to access the controls.
6.2 Shutdown Conditions

Under various entrapment conditions the operator will assume either a soft or hard (alarm) shutdown. To determine what type of reset action is required, you will need to understand how the different entrapment conditions affect the gate operator.

**Soft Shutdown (NO Alarm will Sound)**

This occurs in various situations where the inherent or external entrapment protection devices have been activated. In a soft shutdown condition, the operator will not respond to any input that was present when the entrapment protection device sensed an obstruction. If the gate stops at the open position, the operator will not respond to the automatic close timer.

- **Example 1** - A time clock keys the gate open in the morning and an entrapment protection device senses an obstruction prior to the gate reaching the full open position. If the entrapment is sensed by the inherent system, the gate will reverse and run back to the closed position. The time clock input is still present, but the gate will not re-open.

  Note: In some systems, the time clock input comes from the telephone entry system relay. This same relay may also provide open commands for a card reader, MicroPLUS transmitters and the visitor telephone entry. If so, these devices will also be disabled in a soft shutdown condition.

- **Example 2** - If the gate is closing and an entrapment protection device is activated, the gate will either stop or reverse and run back to the open position, depending upon if the secondary or inherent device was activated. The automatic close timer will not close the gate.

- **Example 3** - Vehicle arrives at exit loop and gate runs towards the open position. If the inherent entrapment protection gets activated during this opening cycle, the gate reverses and runs back to the closed position. After the inherent entrapment protection is cleared, If the vehicle is still present at the exit loop, a soft shutdown condition does not occur. The exit loop input provides an immediate reset of the operator and the gate will again run to the open position.

**Soft Shutdown (NO Alarm will Sound)**

Resetting a Soft Shutdown

In some conditions, a soft shutdown will reset as soon as the entrapment condition clears. For example, if a non-contact sensor (photocell) is sensing an obstruction, the operator will stop the gate and assume a soft shutdown condition. When the photocell clears, the operator will return to normal operation.

When the operator is in a soft shutdown, activation of any “intended input” will reset the operator. An “intended input” includes any command, any standard safety input and any loop input. Activating any of these inputs will reset the gate. At that point the gate will return to normal operation. If the gate is open, the automatic close timer will then time out and close the gate.

**Example of a Hard Shutdown**

A hard shutdown condition occurs when: (1.) The inherent entrapment protection system (Type A) gets activated TWO consecutive times before the gate completes the open or close cycle. (2.) The reversing edge (Type B2) gets activated and reverses but before the gate completes the reverse cycle the inherent entrapment protection system (Type A) gets activated.

- **Example of a Hard Shutdown** - The gate is closing and the inherent entrapment protection system senses an obstruction and causes the gate to reverse direction. As the gate begins to run in the open direction, a second obstruction is sensed prior to the gate reaching the full open position. Once the second obstruction has been sensed, the operator will stop, the audio alarm will sound and all standard inputs are shut down (including open commands, safety commands, loop inputs, etc.).

  - To silence the alarm, press the alarm reset button or after 5 minutes, the audio alarm will shut off but will “chirp” every 5 seconds. This indicates that the operator is in a hard shutdown condition (The alarm reset button must be pressed to reset the operator and stop the alarm “chirping”).

**Hard Shutdown (Alarm Activated)**

A hard shutdown condition occurs when: (1.) The inherent entrapment protection system (Type A) gets activated TWO consecutive times before the gate completes the open or close cycle. (2.) The reversing edge (Type B2) gets activated and reverses but before the gate completes the reverse cycle the inherent entrapment protection system (Type A) gets activated.

**Resetting a Hard Shutdown**

The operator is in a hard shutdown condition when the audio alarm is sounding OR “chirping” every 5 seconds.

- Before resetting a hard shutdown, determine why the shutdown occurred. Inspect the gate for any obstructions along its path that could have activated the inherent entrapment sensing system. Inspect the gate and gate hardware.

  - The audio alarm will sound for five minutes, or until the operator’s alarm reset button is pushed. After (5) five minutes the alarm will “chirp every 5 sec.” and the hard shutdown condition will remain in affect until the alarm reset button is pushed.

Once the operator has been reset, an open or close command is needed to start the gate operator. Most activating commands will cause the gate operator to cycle to the open position. This includes activation of a key switch or open command and activation of an automatic exit loop. Activation of a close command will run the gate to the closed position.

Note: DoorKing operators have a built-in alarm reset push button mounted on the operator (See previous page for alarm reset button location). Activating this button will return the gate operator to normal operation, but will not cycle the gate operator.
6.3 Manual Gate Operation

**Caution:** Never attempt to manually operate any gate until you have verified that **ALL** power to operator has been shut-off.

1. **Pull Manual Release Handle**
   Pull straight **OUT** as far as possible and then **UP**.

2. **Release Handle**
   With handle in **UP** position, slide back down to lock it in manual release position.

3. **Manually Push Gate to Desired Position**
Inspection and service of this gate operator by a qualified technician should be performed anytime a malfunction is observed or suspected. High cycle usage may require more frequent service checks.

### 7.1 Maintenance

When servicing the gate operator, always check any secondary (external) reversing devices (loops, photocells, etc.) for proper operation. If external reversing devices cannot be made operable, do not place this operator in service until the malfunction can be identified and corrected. Always check the inherent reversing system when performing any maintenance. If the inherent reversing system cannot be made operable, remove this operator from service until the cause of the malfunction is identified and corrected. Keeping this operator in service when the inherent reversing system is malfunctioning creates a hazard for persons which can result in serious injury or death should they become entrapped in the gate.

When servicing this gate operator, always turn power OFF!! If gearbox requires oil, use only Mobil SHC-629 Synthetic Gear Oil. Do not completely fill gearbox with oil. Gearbox should be half full only. Do not exceed this level.

### 7.2 Built-in Diagnostics

This gate operator is designed with built-in diagnostics that will alert you to potential or existing problems that the microprocessor has detected. Specific fault conditions are checked and the operator will signal that a fault exist through the built-in alarm.

**Constant alarm is heard when power is applied:** This indicates that the limit switch wire harness is not connected to the circuit board. In this condition, the operator will not run and the tone will continue until the fault is corrected. Check to be sure that the limit switch plugs are properly inserted into P2 and P8.

**Constant alarm is heard:** This indicates that the operator is in a hard shutdown condition. The alarm will continue to sound for five minutes, and then will “chirp” once every five seconds. The alarm reset button must be pressed or power must be removed and then reapplied to return the operator to normal operation.

**Short “alarm chirp” is heard every five seconds:** This indicates that the operator has been in a hard shutdown condition in excess of five minutes. This will continue until the alarm reset button is pressed or until power is removed from the operator.

**Operator runs for 1 second and stops, two short “alarm chirps” are heard:** This indicates that there may be a fault with the primary current sensor circuit. Check that the black current sensor wire has been passed through the hole in the primary current sensor donut on the circuit board with the correct number of loops (1/2 HP motor - 2 loops, 1 HP motor - 1 loop).
# 7.3 Troubleshooting

Have a good VOM meter with Min/Max test button to check voltages and continuity. A Meg-Ohm meter capable of checking up to 500 meg-ohms of resistance is necessary to properly check the integrity of the ground loops. When a malfunction occurs, isolate the problem to one of three areas: 1) the operator, 2) the loop system, 3) the keying devices. **Use caution when checking high voltage areas.**

1. Check the input indicator LEDs. They should only come ON when a keying device (card reader, push button, etc.) is activated. If any of the input LEDs are ON continuously, this will cause the gate operator to hold open. Disconnect the keying devices one at a time until the LED goes OFF.

2. Check any external entrapment protection devices. Any short or malfunction in these devices can cause the gate operator to stop or to hold open.

3. A malfunction in a loop or loop detector can cause the gate operator to hold open, or to not detect a vehicle when it is present over the loop. The LEDs next to the loop detector ports on the operator circuit board will light only when the loop has detected an object above it. If the LEDs stays on after the object has gone, then the loop detector has malfunctioned. Pull the loop detector circuit boards from the loop ports on the operator circuit board. If the malfunction persists, the problem is not with the loop system. For more information on trouble shooting loops and loop detectors, refer to your loop detector instruction sheet and to the DoorKing Loop and Loop Detector Information Manual.

4. Check to be sure that there are no shorted or open control wires from the keying devices to the gate operator. If a keying device fails to open the gate, momentarily jumper across terminals 1 and 2 (or 1 and 6) on the gate operator circuit board. If the gate operator starts, this indicates that a problem exist with the keying device and is not with the gate operator.

5. Check the high voltage supply. A voltage drop on the supply line (usually caused by using too small supply voltage wires) will cause the operator to malfunction. Refer to the wire size chart in section 2.1 page 17.

<table>
<thead>
<tr>
<th>Symptom</th>
<th>Possible Solution(s)</th>
</tr>
</thead>
</table>
| Operator will not run. Power LED is OFF. | - Check that power to the operator is turned ON.  
- Check for AC power (115/230) at the power input terminals. If power is absent, check incoming power to operator.  
- Be sure AC power switch is ON. Check for 24 VDC at P2, terminals 1 (+) and 2 (-). If no power, faulty bridge rectifier or toroidal transformer. If power is present, possible faulty board. |
| Operator will not run. Power LED is ON. | - Insure that a minimum of one (1) entrapment protection device is connected and the input it is connected to is enabled (UL 325-DIP switch is ON).  
- Press “Push to Operate” button or momentarily jumper terminal 1 to terminal 2 (or 1 to 6). If the input LED does not come ON, check the terminal strip or replace the circuit board. If LED does come ON, proceed to next steps.  
- **Check Motor:** Gate must be half way open before testing motor.  
  1. **Turn AC power OFF** and remove plug P2 from circuit board. On the P2 terminal, connect terminal 1 to terminal 5 and terminal 2 to terminal 6. Turn AC power **ON – CAUTION – HIGH VOLTAGE.** The motor should run, turn power **OFF.**  
  2. **With AC power still OFF.** Connect terminal 1 to terminal 6, and terminal 2 to terminal 5. Turn AC power **ON – CAUTION – HIGH VOLTAGE.** The motor should run in the opposite direction as terminal 1 to terminal 5 and terminal 2 to terminal 6, turn power **OFF.**  
  3. If the motor does not run, or runs in only one direction, problem can be a bad motor, wire connections from the control board to the motor or a bad control board. If the motor runs in both steps above, continue troubleshooting control board and accessories. |

7.4 Accessory Items

UL 325 Monitored Entrapment Protection Devices available for the model 9024 swing gate operator.

**Type B2 Contact Sensors (Reversing Edge)**
- Miller Edge Sensing Edges - all models with a T2 (resistive) termination.
- Miller Edge Monitored Gate Link Model MGL-K20
- Miller Edge wireless monitored transmitter/receiver kit model RB-G-K10
- ASO GMBH Sentir GF Series sensing edges

**Type B1 Non-contact Sensors (Photo Cell)**
- Miller Edge Reflective-Guard Model RG
- Miller Edge Prime-Guard Model PG
- EMX Industries Model IRB-MON
- EMX Industries Model IRB-RET
- Omron Model E3K-R10K4
- Seco-Larm Model E-936-S45RRGQ
- Seco-Larm Model E-960-D90GQ

**Monitored Expansion Kit**
- Miller Edge Multi-Input Module Model MIM-62

Accessory items available for the model 9024 slide gate operator.

**Plug-In Loop Detector** - Detectors plug directly into ports on circuit board simplifying wiring.
- Single channel detector - P/N 9410-010
- Dual channel detector - P/N 9409-010
- Single channel detector with aux relay - P/N 9411-010
- Single channel low power draw detector - P/N 9416-010
- Dual channel low power draw detector - P/N 9415-010

**External Loop Detector**
- Reno A&E 12/24 VDC or 24 VAC - 9402-045
- Reno A&E 120 VAC - 9402-047
- Carlo Gavazzi 24 VAC/VDC - 9402-044
- Diablo 10-30 VAC/VDC low power draw - 9402-050

**Loop Wire** - 18 AWG loop wire with XLPE insulation is ideal for ground loops. Available in 500 and 1000 foot rolls. Red, blue or black insulation.

**Pre-Fab Loops** - Prefabricated ground loops. 24-foot circumference with 50-foot lead-in. Available in yellow, red or blue jackets. Not for use in asphalt roadways.

**Loop Test Meter** - Meg-ohm meter checks the integrity of ground loops. P/N 9401-045

**Time Clock** - 7 day time clock can be used to automatically open gate at pre-set time and days. Compact clock fits inside the operator.
- 7 day clock - P/N 2600-791
- 115 VAC Heater with Fan Assembly Kit - Thermostatically controlled heater and fan for cold and hot environments.
  - For 115 VAC input power ONLY. P/N 1601-154
- 208/230 VAC Heater with Fan Assembly Kit - Thermostatically controlled heater and fan for cold and hot environments.
  - For 208/230 VAC input power ONLY. P/N 1601-197
- V-Wheels - 4 inch and 6 inch. UHMW or Steel. Roller bearings or sleeve bearings. Single or tandem wheel configurations.

**Endless Idler Assembly with Protective Cover** - Use when gate operator chain needs 180° return. P/N 2600-818

**Guide Rollers with Protective Covers** - A variety of sizes to support slide gates.

**Gate End Retainer** - Fits on top of end post and helps stabilize the end of the gate in the open or closed position (End post NOT provided).
- P/N 1204-004

**Post Mount Kit** - Required for post mount installation. P/N 9000-015.

**Chain Tray Kit** - 10 Ft. section. Sections connect together to fit any length gate. P/N 2601-270

**Additional #40 Chain** - 20 ft. per box. P/N 2600-442

**Surge Devices** - High and low voltage surge suppressors help prevent circuit board failure caused by lightning strikes and power surges.
- High Voltage - P/N 1879-010
- Low Voltage - P/N 1878-010

**Speed Bumps** - Prefabricated six-foot speed bump reduces traffic speed through gate system. P/N 1610-150

**Standard Battery** - 12 Volt 7.2 Amp/Hr. P/N 1801-003. Two (2) required.
- 12 Volt 18 Amp/Hr Extended Battery - P/N 1801-004. Two (2) required.
Model 9024-080 AC Input Power

- Limit Switch
- Partial Open Sensor
- Limit Switch
- Alarm
- Alarm Reset Button
- AC Power Switch
- AC Power Input Terminal
- Transformer Toroidal
- Bridge Rectifier
- 30A Fuse
- Capacitor 4700uF
- Resistor 1K
- Battery 12V 7.2Amp/Hr
- Remote Radio Receiver Terminal

Note: Not available when using solar power.
8.1 Alarm Sounding and Gate WILL NOT Operate

When alarm is sounding...

ALWAYS CHECK GATE AREA FOR ANY OBSTRUCTIONS FIRST.

If the cause of the alarm cannot be corrected, shut-off power and DO NOT place this operator back into service until the malfunction can be identified and CORRECTED.

IMPORTANT: Putting this gate operator back into service without CORRECTING the cause of the alarm could result in serious injury or DEATH!

The audio alarm will sound for five minutes, or until the operator’s reset button is pushed. After (5) five minutes the alarm will “chirp every 5 sec.” and the hard shutdown condition will remain in affect until the reset button is pushed.

Gate Operator is in a Hard Shutdown Condition when Alarm is Sounding

This occurs when:
1. The inherent entrapment protection system (Type A) gets activated TWO consecutive times before the gate completes the open or close cycle.
2. The reversing edge contact sensor (Type B2) gets activated and reverses but before the gate completes the reverse cycle the inherent entrapment protection system (Type A) gets activated.

UNLOCK the control panel cover with KEY and press RESET BUTTON. This will reset the gate operator and allow normal gate operation again.

Please read SECTION 6 - OPERATING INSTRUCTIONS for more information about operating this gate operator.
8.2 Manual Gate Operation

Caution: NEVER attempt to manually operate the gate until you have VERIFIED that ALL power to the gate operator has been SHUT-OFF! (AC Power and DC Power)

Please read SECTION 6 - OPERATING INSTRUCTIONS for more information about operating this gate operator.

A KEY has been supplied that will unlock the control panel cover on this gate operator.

Note: The owner of the gate operator is responsible for the KEY availability.

Gate CANNOT be manually PUSHED open until MANUAL RELEASE HANDLE has been RELEASED.

1 Pull Manual Release Handle
Pull straight OUT as far as possible and then lift handle UP.

2 Release Handle
With handle in UP position, slide back down to lock it in manual release position.

3 Manually Push Gate Open
8.3 Gate Operator’s Monthly Checkup

**Caution:** Make SURE gate area is clear BEFORE testing the gate operator!

DO NOT repair or adjust gate systems yourself. Contact a trained gate systems technician with any questions or to make any repairs or adjustments. If you feel uncomfortable performing any of these inspections or testing, a qualified service technician will perform the visual inspections and testing for you.

You can find a trained service technician at DoorKing’s “Dealer Locator” at www.doorking.com

**Visual Inspection**

Visually inspect the rollers, fasteners, brackets and other gate hardware for proper alignment, proper tightness, and signs of damage, breakage, looseness, rust or wear. Moving parts should be lubricated and should not be squeaking.

Visually inspect wiring for fraying or exposure. If a malfunction is found, contact a trained service technician to make adjustments or repairs.

**Test Built-In Reversing Sensor**

Begin with the gate in the fully OPEN position. Stand just outside the path of the gate and close the gate (typically auto-timer will time-out and close gate automatically). As the gate is closing, firmly press a solid object against the end of the gate frame in the direction opposing the travel of the gate. The gate should stop within 2 sec. and reverse to the OPEN position. Another input command is needed before the gate will reset and close again. Repeat this test while opening the gate. Start from the fully CLOSED position. While opening, gate should stop and reverse to the CLOSE position. If gate does NOT respond like it should in either direction of gate travel, contact a trained service technician to make adjustments or repairs.

**Test Photo Sensors**

If the gate has a photo sensing device protecting the path of a closing gate, perform the following test. Begin with the gate in the fully OPEN position. Stand just outside the path of the gate and close the gate (typically auto-timer will time-out and close gate automatically). Pass an object across the path of the closing photo sensing beam. The gate should stop within 2 sec. and reverse to the OPEN position. Typically the auto-timer times out and gate closes again.

If the gate has a photo sensing device protecting the path of an opening gate, start from the fully CLOSED position. OPEN gate. Pass an object across the path of the opening photo sensing beam. The gate should stop, the gate will resume opening when the beam is clear. If gate does NOT respond like it should in either direction of gate travel, contact a trained service technician to make adjustments or repairs.

**Test Reversing Edges**

If the gate has a reversing edge(s) protecting the path of a closing gate, perform the following test. Begin with the gate in the fully OPEN position. Stand just outside the path of the gate and close the gate. As the gate is closing, firmly press a solid object against the reversing edge in the direction opposing the travel of the gate. The gate should stop within 2 sec. and reverse to the OPEN position (typically auto-timer will time-out and close gate automatically). If the gate encounters another obstruction before it is closed, the gate will stop and reverse to the OPEN position again. A input command is needed before the gate will reset and close again, auto-timer will NOT close gate (Typically, press your remote button for input command). If the gate has a reversing edge(s) protecting the path of an opening gate, starting from the fully CLOSED position. Stand just outside the path of the gate and open the gate. OPEN gate. As the gate is opening, firmly press a solid object against the reversing edge in the direction opposing the travel of the gate. The gate should stop and reverse to the CLOSE position. If gate does NOT respond like it should in either direction of gate travel, contact a trained service technician to make adjustments or repairs.

**Note:** This gate operator uses high levels of force to move the gate and most people underestimate the power of these systems and do not realize the potential hazards associated with this system if NOT maintained properly.

Scheduled maintenance visits are offered by most qualified service technicians to MAINTAIN your gate operator system.
**SECTION 6 - OPERATING INSTRUCTIONS**

**Please read for more information about operating this gate operator.**

**3. Manually Push Gate Open**

- If the gate is stuck, push the handle in the manual release position. Slide back down to lock it in its position.

**2. Release Handle**

- Pull Manual Release Handle.

**1. Gate Cannot be manually pushed open until Manual Release Handle has been released.**

   *Caution: Never attempt to manually operate the gate until you have verified that all power to the gate operator has been SHUT-OFF! (AC power and DC power.)*

   **Always check gate area for any obstructions first!**
Entrapment Protection must be provided for the gate system where the risk of entrapment or obstruction exists. The operator will not run without one or more monitored type B1 or B2 entrapment protection devices.
